REGULATORY COMPLIANCE STATEMENT

Product(s) associated with this publication complies/comply with all applicable regulations. For more details, refer to the <u>Technical Specifications</u> section.

WARRANTY

iS5 warrants that all products are free from defects in material and workmanship for a specified warranty period from the invoice date (5 years for most products). iS5 will repair or replace products found to be defective within this warranty period including shipping costs. This warranty does not cover product modifications or repairs done by persons other than iS5-approved personnel, and this warranty does not apply to products that are misused, abused, improperly installed, or damaged by accident.

Refer to the <u>Technical Specifications</u> section for the actual warranty period(s) of the product(s) associated with this publication.

DISCLAIMER

Information in this publication is intended to be accurate. iS5 shall not be responsible for its use or infringements on third-parties because of the use of this publication. There may occasionally be unintentional errors on this publication. iS5 reserves the right to revise the contents of this publication without notice.

FCC STATEMENT AND CAUTIONS

Federal Communications Commission Radio Frequency Interference Statement

This equipment has been tested and found to comply with the limits for a Class A digital device pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment can generate, use, and radiate radio frequency energy. If not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will at his/her own expense, be required to correct the interference.

This is a class A product. In a domestic environment, this product may cause radio interference in which case the user may be required to take adequate measures.

Caution: LASER

This product contains a laser system and is classified as a CLASS 1 LASER PRODUCT. Use of controls or adjustments or performance of procedures other than those specified herein may result in hazardous radiation exposure.

Caution: Service

This product contains no user-serviceable parts. Attempted service by unauthorized personnel shall render all warranties null and void.

Changes or modifications not expressly approved by iS5 Communications Inc. could invalidate specifications, test results, and agency approvals, and void the user's authority to operate the equipment. Should this device require service, please contact support@iS5Com.com.

Caution: Physical Access

This product should be installed in a restricted access location. Access should only be gained by qualified service personnel or users who have been instructed on the reasons for the restrictions applied at the location, and any precautions that have been taken. Access must only be via the use of a tool or lock and key, or other means of security, and is controlled by the authority responsible for the location.

1. GETTING STARTED

1.1 About iES22GF

The iES22GF is an intelligent managed 20 port Gigabit Ethernet switch with 8 x 10/100/1000Base-T(X) RJ45 ports and up to 12 x 100/1000Base-X SFP ports.

The switch is IEC 61850-3 and IEEE 1613 compliant.

The iES22GF provides redundancy support through functions such as STP/RSTP/MSTP assuring protection of all mission critical network applications. iES22GF can be managed via the Web UI, iManage Software Suite, Telnet, and Console (CLI) / SSH v2.

The switch is made of IP-40 galvanized steel and has a wide operating temperature range from -40° C to $+85^{\circ}$ C, which is suitable for the harshest of environments without the use of fans.

1.3 Acronyms

The following table shows all acronyms used in this document.

Acronym	Explanation
ACE	Access Control Entry
ACL	Access Control List
AF	Assured Forwarding
ARP	Address Resolution Protocol
BPDU	Bridge Protocol Data Unit
CIST	Common and Internal Spanning Tree
СП	Command Line Interface
DCHP	Dynamic Host Configuration Protocol
DDM	Digital Diagnostic Monitoring

Acronym	Explanation
DEI	Discard Eligibility (subfield in an IEEE 802.1Q frame header)
DNS	Domain Name Server
DSAP	Destination Service Access Point
DSCP	Differentiated Services Code Point
DP	Drop Precedence
EAP	Extensible Authentication Protocol
EAPOL	EAP Over LAN
HLN	Hardware Address Length
HRD	hardware address space (i.e. ARP <i>hardware address</i> type (ar\$ <i>hrd</i>)))
HSR	High-availability Seamless Redundancy
HTTPS	Hyper Text Transfer Protocol Secure or HTTP over SSL
ICMP	Internet Control Message Protocol
IGMP	Internet Group Management Protocol
IP	Internet Protocol (IP)
IPMC(v4)	IPv4 MultiCast
LAG	Link Aggregation Group
LACP	Link Aggregation Control Protocol
ITDb	Link Layer Discovery Protocol
LLDP- MED	LLDP - Media Endpoint Discovery
ITDbDA	LLDP Data Unit
MIB	Management Information Base
MRP	Media Redundancy Protocol
MSTI	Multiple Spanning Tree Instances
MSTP	Multiple Spanning Tree Protocol
NTP	Network Time Protocol
OID	Object Identifier

Acronym	Explanation
OUI	Organizationally Unique Identifier (In Linux)
PDU	Protocol Data Unit
PID	Process Identifier
P2P	Point-To-Point (link)
PSH	Push Function (a value for the ACE)
PWR	Power
QCE	QoS Control Entry
QCL	QoS Control List
QoS	Quality of Service
RARP	Reverse Address Resolution Protocol (Reverse ARP)
RIP	Routing Information Protocol
RMON	Remote Monitoring
RSTP	Rapid Spanning Tree Protocol
SIP	Source IP
SMAC	Source MAC Address
SNMP	Simple Network Management Protocol
SNTP	Simple Network Time Protocol
SSAP	Source Service Access Point
SSH	Secure Shel
TACACS	Terminal Access Controller Access Control System
TCN	Topology Change Notification
ТСР	Transmission Control Protocol
THA	target Hardware Address
TLV	Type-Length-Value
TPID	Tag protocol identifier
TTL	Time to live

Acronym	Explanation
SSH	Secure Shell
UDP	User Datagram Protocol
URG	Urgent Pointer Field Significant (an ACE value)
USM	User-based Security Model
UTC	Coordinated Universal Time
VACM	View based Access Control Model
VCXO	Voltage Controlled Crystal Oscillator
VID	VLAN ID

1.4 Software Features

- Web or CLI based Management (Console or Telnet / SSH v2)
- DHCP Server / Relay
- VLAN (802.1Q) for segregating and securing network traffic
- Supports SNMPv1/v2/v3
- Traffic Prioritization—Storm Control and Quality of Service (QoS) including DSCP-Based QoS Ingress Port Classification
- Multicast traffic—IGMP Snooping (IGMP v1/v2 / v3) and unregistered IPMCv4 Flooding
- Warnings (Syslog and SMTP) and Fault Alarm (power failure)
- Monitoring and Diagnostics—MAC Table and Port Statistics (ports monitoring including for SFP ports, system information, issuing PING packets for troubleshooting IP connectivity issues)
- SNTP for synchronizing of clocks over network
- Supports standard IEC 62439-2 MRP (Media Redundancy Protocol) functionality

1.5 Hardware Specifications

Description	Specification	
10/100/1000 Base-T(X) RJ45 Ports Auto MDI/MDIX	8	
100/1000Base-X SFP Ports	Up to 12	
RS-232 Serial Console Port	RS-232 in RJ45 connector with console cable: 115200 bps, 8, N, 1	
Warning / Monitoring System	 Relay output for fault event alarming 2 alarm warning methods for system events supported: SYSLOG with server / client structure; recording and viewing events in the System Event Log SMTP for notification via email Event selection per port 	
Alarm	Relay output to carry capacity of 1 A at 24 VDC	
Physical Characteristics		
Enclosure	IP-40 Galvanized Steel	
Dimensions (W x D x H)	133.7 (W) x 157.5 (D) x 154.1 (H) mm (5.27 x 6.20 x 6.07 inches)	
Weight (g)	~3500 g	
Power		
Input Power	Redundant Power Supplies: Dual DC Inputs 9-36VDC, Dual DC Inputs 36-75VDC, or Dual Input 110-370VDC or 90-264VAC	
Power Consumption (Typ.)	18 Watts	
Overload Current Protection	Present	
Reverse Polarity Protection	Internal	

2. HARDWARE OVERVIEW

2.1 Front Panel

iS5 provides the following modules:

Description	Specification
10/100/1000 Base-T(X) RJ45 Ports Auto MDI/MDIX	8
100/1000Base-X SFP Ports	Up to 12
RS-232 Serial Console Port	RS-232 with RJ45 connector with console cable: 115200 bps, 8, N, 1

- l Reset button. Push the button 3 seconds for reset; 5 seconds for factory default.
- 2 LED for PWR. When the PWR UP, the green led will be light on
- 3 LED for PWR1
- 4 LED for PWR2
- 5 LED for R.M (Ring master). When the LED light on, it means that the switch is the ring master of Ring. LED for Ring. When the led light on, it means the Ring is activated.
- 6 LED for Ring. When the led light on, it means the iRing is activated.
- 7 LED for Fault. When the light on, it means Power failure or Port down/fail.
- 8 Console port (RJ-45)
- 9 100/1000 Base-X SFP
- 10 LED for Ethernet ports link status.
- 11 LED for Ethernet ports speed status
- 12 10/100/1000Base-T(X) ports
- 13 LED for SFP ports link status.
- 14 100/1000 Base-X SFP

LED	Color	Status	Description
PWR	Green	On	DC power module up
PW1	Green	On	DC power module 1 activated.
PW2	Green	On	DC Power module 2 activated.
R.M	Green	On	Ring Master.
		On	Ring enabled.
Ring	Green	Slowly blinking	Ring has only One link. (lack of one link to build the ring.)
		Fast blinking	Ring work normally.
Fault Amber On Po		Fault relay. Power failure or Port down/fail.	
10/100/1000Base-T(X) Fast Ethernet ports			
LNK	Green	On	Port link up.
АСТ	Green	Blinking Data transmitted.	
Full Duplex	Amber	On Port works under full du	
SFP			
LNK	Green	On	Port link up.
АСТ	Green	On	Data transmitted.

2.2 Front Panel LED

2.3 Bottom View of Panel

The Phillips Screw Terminal Block, located on the bottom of the unit, has Phillips screws with compression plates, allowing either bare wire connections or crimped terminal lugs. The use of #6 size ring lugs is recommended to ensure secure and reliable connections under severe shock or vibration. The terminal block comes with a safety cover which must be removed before connecting any wires. This cover must be re-attached after wiring to ensure personnel safety.

The iES10G series supports dual redundant power supplies (PWR1 and PWR2). There are 3 options:

- LV: Dual Input 9-36VDC
- MV: Dual Input 36-75VDC
- HV: Single Input 110-370VDC or 90-264VAC

There are also connections for the Failsafe Relay. The Failsafe Relay is rated 1A @ 24VDC. Connections to the Terminal block are listed in the table below.

Terminal Number	Description	Connection
1	PWR1 (L) – Live	Connect to the (Live) of DC power supply 1 or (Live) terminal of an AC power source.
2	PWR1 (G) – Ground	DC Power supply 1 ground connection or AC power round connection.
3	PWR1 (N) – Neutral	Connect to the Neutral of the DC power supply 1 or (Neutral) terminal of an AC power source.
4	G – Chassis Ground	Connected to the ground bus for DC inputs or Safety Ground terminal for AC Units. Chassis Ground connects to both power supply surge grounds via a removable jumper.
5	PWR2 (L) – Live	Connect to the (Live) terminal of Power supply 2 or backup DC power source.
6	PWR2 (G) – Ground	Power supply 2 or backup DC power source ground connection.
7	PWR2 (N) – Neutral	Connect to the (Neutral) terminal of Power supply 2 the second or backup DC power source.
8	RLY NO	Failsafe Relay, (Normally Open) contact.
9	RLY CM	Failsafe Relay (Common) contact.
10	RLY NC	Failsafe Relay (Normally Closed) contact.

Chassis Ground Connection

The iES22GF chassis ground connection, located next to the terminal block, uses a #6-32 Screw. We

recommend terminating the ground connection using a #6 ring lug, and a torque setting of 15 in.lbs

(1.7Nm).

2.4 Rear Panel

The components on the rear of the iES22GF are shown below:

- 1. Screw holes (4) for wall mount kit.
- 2. DIN-Rail mount

Figure 1 – Rear Panel

2.5 Side Panel

The components on the side of the iES10G are shown below:

1. Screw holes (4) for wall mount kit.

Figure 2 – Side Panel

3. HARDWARE INSTALLATION

3.1 Installing the Switch on DIN-Rail

Each switch has a DIN-Rail bracket on the rear panel. The DIN-Rail bracket helps secure the switch on to the DIN-Rail.

3.1.1 Mounting on DIN-Rail

Step 1: Slant the switch and hook the top 2 catches of the metal bracket onto the top of the DIN-Rail.

Figure 3 - DIN-Rail Bracket

Step 2: Push the bottom of the switch toward the DIN-Rail until the bracket snaps in place.

Figure 4 - Switch Mounted on DIN-Rail

3.2 Wall Mount Installation

The switch can also be panel or wall mounted. The following steps show how to mount the switch on a panel or wall.

3.2.1 Mounting iES22GF on a Wall or Panel

Option 1: Side of switch

Fix mounting brackets to the side of switch using the 4 screws included in the package.

Figure 5 - Brackets Mounted on Side of Switch

Option 2: back of switch:

Fix mounting brackets to back of switch using 4 screws included in the package.

Figure 6 - Brackets Mounted on back of Switch

Note: To avoid damage to the unit, only use the screws provided to mount the panel mount.

3.3 Connection

3.3.1 Ethernet Cables

The iES22GF switches have standard Ethernet ports. According to the link type, the switches use CAT 3, 4, 5, and 5e UTP cables to connect to any other network device (e.g. PCs, servers, switches, routers, or hubs). For cable types and specifications, refer to the following table.

Cable	Туре	Max. Length	Connector
10BASE-T	Cat. 3, 4, 5 100-ohm	UTP 100 m (328ft)	RJ-45
100BASE-TX	Cat. 5 100-ohm UTP	UTP 100 m (328ft)	RJ-45
1000BASE-T	Cat. 5/Cat. 5e 100-ohm UTP	UTP 100 m (328ft)	RJ-45

Table 1 – Port Numbering

3.3.2 Pin Assignments

With 10/100/1000BASE-T(X) cables, pins 1 and 2 are used for transmitting data, and pins 3 and 6 are used for receiving data. All pin assignments are as follows:

Pin Number	Assignment
1	TD+
2	TD-
3	RD+
4	Not used
5	Not used
6	RD-
7	Not used
8	Not used

Table 2 – 10/100 Base-T(X) Line Pin Assignments

Table 3 – 1000 Base-T Line Pin Assignments

Pin Number	Assignment
1	BI_DA+
2	BI_DA-
3	BI_DB+
4	BI_DC+
5	BI_DC-
6	BI_DB-
7	BI_DD+
8	BI_DD-

The iES22GF supports Auto MDI/MDI- X operation. Use a cable to connect the switch to a PC.

Pin Number	MDI port	MDI-X port
1	TD+(transmit)	RD+(receive)
2	TD-(transmit)	RD-(receive)
3	RD+(receive)	TD+(transmit)
4	Not used	Not used
5	Not used	Not used
6	RD-(receive)	TD-(transmit)
7	Not used	Not used
8	Not used	Not used

Table 4 – 10/100 Base-T(X) MDI/MDI- X Pin Assignments

Table 5 – 1000 Base-T MDI/MDI- X Pin Assignments

Pin Number	MDI port	MDI-X port
1	BI_DA+	BI_DB+
2	BI_DA-	BI_DB-
3	BI_DB+	BI_DA+
4	BI_DC+	BI_DD+
5	BI_DC-	BI_DD-
6	BI_DB-	BI_DA-
7	BI_DD+ BI_DC+	
8	BI_DD-	BI_DC-

Note: "+" and "-" signs represent the polarity of the wires that make up each wire pair.

3.3.3 SFP

The switches come with fiber optical ports that can connect to other devices using SFP modules. The fiber optical ports are multimode or singlemode with LC connectors. Remember that the TX port of Switch A should be connected to the RX port of Switch B.

3.4 Console Cable

The switches can be managed via the console port (a RS-232 Serial interface) by a RS-232 cable supplied with the switch. Connect the port to a PC using the RS-232 cable with an RJ-45 connector to a DB-9 female connector. The DB-9 female connector of the RS-232 cable should be connected to the PC, while the other end of the cable (with the RJ-45 connector) should be connected to the console port of the switch (Standard Cisco Serial Cable supplied with iRBX6GF).

PC COM Port **Console Port DB-9 RJ-45** Pins Signals **Pins Signals** NC^1 1 \mathbf{NC}^1 2 TXD^2 RXD³ 3 2 GND^4 GND^4 4 5 GND^4 5 5 GND^4 RXD³ 6 3 TXD^2 NC^1 7 \mathbf{NC}^1 8 ____ ____ 1. NC indicates not connected. 2. TXD indicates transmit data

 Table 6 – Signals and Pinouts from Console Port RJ-45 to DB-9 Serial Port Adapter

- 3. RXD indicates receive data
- 4. GND indicates ground

Figure 8 – Console Cable Connection

4. REDUNDANCY OVERVIEW

Using redundancy for minimizing system downtime is one of the most important concerns for industrial networking devices. The existing redundancy technologies widely used in commercial applications are STP, RSTP, and MSTP.

4.1 STP/RSTP/MSTP

4.1.1 STP/RSTP

STP (Spanning Tree Protocol), and its advanced versions RSTP (Rapid Spanning Tree Protocol) and MSTP (Multiple Spanning Tree Protocol), are designed to prevent network loops and provide network redundancy. Network loops occur frequently in large networks when two or more paths run to the same destination, broadcast packets could get in to an infinite loop and cause congestion in the network. STP can identify the best path to the destination and block all other paths. The blocked links will stay connected but inactive. When the best path fails, the blocked links will be activated. Compared to STP which recovers a link in 30 to 50 seconds, RSTP can shorten the time to 5 to 6 seconds.

4.1.2 **MSTP**

MSTP was developed to improve recovery times since STP and RSTP takes seconds, which is not acceptable in some industrial applications. MSTP supports multiple spanning trees within a network by grouping and mapping multiple VLAN's into different spanning-tree instances, known as Multiple Spanning Tree Instances (MSTI)'s, forming individual MST regions. Each switch is assigned an MST region. Each MST region consists of one or more MSTP switches with the same VLAN's, at least one MST instance, and the same MST region name. This allows the switches to use different paths in the network to effectively balance loads.

4.2 Fast Recovery

Fast recovery mode can be set to connect multiple ports to one or more switches. iES22GF with fast recovery modes will provide redundant links. Only the first priority will be the active port, the other ports with different priorities will be backup ports.

5. Web Management

This section introduces configuration of the switch by a web browser.

An embedded HTML web site resides in the flash memory of the CPU board. It contains advanced management features that allow the user to manage the iRBX6GF switch from anywhere on the network via a standard web browser such as Microsoft Internet Explorer.

The Web Management function supports Internet Explorer 5.0 or later. It is based on Java Applets with an aim at reducing network bandwidth consumption and enhances access speed in a viewing screen. **Note:** By default, IE 5.0 or later versions do not allow Java Applets to open sockets. The browser settings need to be explicitly modified to enable Java Applets to be used on network ports.

The default values are as below:

- **IP Address:** 192.168.10.1
- Subnet Mask: 255.255.255.0
- Default Gateway: 192.168.10.254
- User Name: admin
- **Password:** admin

To login, perform the following:

- 1. Launch Internet Explorer.
- 2. Type http:// and the switch's IP address (default is 192.168.10.1), and then press Enter.

Figure 9 – Switch's IP Address Screen

GET STARTED

- 3. The **Welcome to** screen appears. Click
- 4. The login screen appears (see Figure 10 Login Screen).

Figure 12 – System Information Configuration

Label	Description
	An administratively assigned name for the managed node. By convention,
	this is the node's fully-qualified domain name. A domain name is a text string
	consisting of alphabets (A-Z, a-z), digits (0-9), and minus sign (-). Space is not
System Name	allowed to be part of the name. The first character must be an alpha character.
	And the first or last character must not be a minus sign. The allowed string length
	is 0 to 255.
System Description	Description of the device
System Location	The physical location of the node (e.g., telephone closet, 3^{rd} floor). The
	allowed string length is 0 to 255, and only ASCII characters from 32 to 126
	are allowed.
System Contact	The textual identification of the contact person for this managed node,
	together with information on how to contact this person. The allowed string
	length is 0 to 255, and only ASCII characters from 32 to 126 are allowed.
System Time zone	Provides the time-zone offset from UTC/GMT.
offset (minutes)	The offset is given in minutes east of GMT. The valid range is from -720 to 720 minutes.
Save	Click to save changes.
	Click to undo any changes made locally and revert to previously saved

	Note: value 0-9999 min ; Default: 0 means 10 min

5.1.7 IP Setting

You can configure IP information of the switch in this page.

IP Configuration

	Configured	Current
DHCP Client		Renew
IP Address	172.16.26.249	172.16.26.249
IP Mask	255.255.255.0	255.255.255.0
IP Router	172.16.26.1	172.16.26.1
VLAN ID	1	1
Save Rese	t	

Figure 18 - IP Configuration

Configure the switch-managed <u>IP</u> information on this page.

The **Configured** column is used to view or change the IP configuration. The **Current** column is used to show the active IP configuration.

Label	Description
DHCP	Enable the DHCP client by checking this box. If DHCP fails and the configured IP
Client	address is zero, DHCP will retry. If DHCP server does not respond around 35 seconds
	and the configured IP address is non-zero, DHCP will stop and the configured IP settings
	will be used. The DHCP client will announce the configured System Name as hostname
	to provide DNS lookup.
IP Address	Assigns the IP address of the network in use. If DHCP client function is enabled, there is
	no need to assign the IP address. The network DHCP server will assign the IP address
	to the switch and it will be displayed in this column. The default IP is 192.168.10.1.
IP Mask	Provide the IP mask of this switch <u>dotted decimal notation</u> .
IP Router	Provide the IP address of the router in <u>dotted decimal notation</u> .
VLAN ID	Provide the managed $\underline{\text{VLAN}}$ ID. The allowed range is 1 to 4095.
Renew	Click to renew DHCP. This button is only available if DHCP is enabled.
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.

5.1.8 IPv6 Setting

Configure the switch-managed <u>IP</u>v6 information on this page.

The **Configured** column is used to view or change the IP configuration. The **Current** column is used to show the active IP configuration.

IPv6 Configuration

	Configured	Current
Auto Configuration		Renew
Address	::192.0.2.1	::192.0.2.1 Link-Local Address: fe80::eae8:75ff:fe00:1115

SNTP Server1	:.	
SNTP Server2		::

Save Reset

Figure 19 – IPv6 Configuration

Label	Description
Auto Configuration	Enable IPv6 auto-configuration by checking this box. If system cannot obtain the stateless address in time, the configured IPv6 settings will be used. The router may delay responding to a router solicitation for a few seconds, the total time needed to complete auto-configuration can be significantly longer.

Label	Description
Address	Provide the IPv6 address of this switch. IPv6 address is in 128-bit records represented as eight fields of up to four hexadecimal digits with a colon separating each field (:). For example, 'fe80::215:c5ff:fe03:4dc7'. The symbol '::' is a special syntax that can be used as a shorthand way of representing multiple 16- bit groups of contiguous zeros; but it can appear only once. It can also represent a legally valid IPv4 address. For example, '::192.1.2.34'.
Prefix	Provide the IPv6 Prefix of this switch. The allowed range is 1 to 128 .
Router	Provide the IPv6 gateway address of this switch. IPv6 address is in 128-bit records represented as eight fields of up to four hexadecimal digits with a colon separating each field (:). For example, 'fe80::215:c5ff:fe03:4dc7'. The symbol '::' is a special syntax that can be used as a shorthand way of representing multiple 16-bit groups of contiguous zeros; but it can appear only once. It can also represent a legally valid IPv4 address. For example, '::192.1.2.34'
SNTP Server	Provide the IPv6 SNTP Server address of this switch. IPv6 address is in 128-bit records represented as eight fields of up to four hexadecimal digits with a colon separating each field (:). For example, 'fe80::215:c5ff:fe03:4dc7'. The symbol '::' is a special syntax that can be used as a shorthand way of representing multiple 16-bit groups of contiguous zeros; but it can appear only once. It can also represent a legally valid IPv4 address For example, '::192.1.2.34'.
Renew	Click to renew IPv6 AUTOCONF. This button is only available if IPv6 AUTOCONF is enabled.
Save	Click to save changes
Reset	Click to undo any changes made locally and revert to previously saved values

5.1.9 SNTP Configuration (only for SNTP Version)

Configure SNTP on this page.

5.1.13 HTTPS

HTTPS (HTTP over SSL or HTTP Secure) is the use of Secure Socket Layer (SSL) or Transport Layer Security (TLS) as a sublayer under regular HTTP application layering. HTTPS encrypts and decrypts user page requests as well as the pages that are returned by the Web server.

Configure HTTPS settings in the following page.

HTTPS Configuration

Mode		Disabled	\sim	
Save		Reset		

Figure 24 - HTTPS Configuration
Label	Description
Mode	Indicates the selected HTTPS mode. When the current connection is HTTPS, disabling HTTPS
	will automatically redirect web browser to an HTTP connection. The modes include:
	Enabled: enable HTTPS.
	Disabled: disable HTTPS.
Save	Click to save changes
Reset	Click to undo any changes made locally and revert to previously saved values

5.1.14 SSH

Secure Shell (SSH) is a cryptographic network protocol for operating network services securely over an unsecured network. Typical applications include remote command-line login and remote command execution, but any network service can be secured with SSH.

Configure SSH settings in the following page.

SSH Configuration

Mode Enabled ~ Save Reset

Figure 25 - SSH Configuration

Label	Description			
Mode	Indicates the selected SSH mode. The modes include:			
	Enabled: enable SSH.			
	Disabled: disable SSH.			
Save	Click to save changes.

Reset	Click to undo any changes made locally and revert to previously saved values.

5.1.16 LLDP

5.1.16.1 LLDP Configurations

Link Layer Discovery Protocol (LLDP) is a vendor independent link layer or neighbor discovery protocol used by network devices for advertising their identity, capabilities to neighbors on a LAN segment. Enable LLDP globally to standardize network topology across all devices if you have a multi-vendor network.

This page allows the user to examine and configure LLDP port settings.

LLDP Configuration

LLDP Parameters

Tx Interval 30 seconds

LLDP Port Configuration

Port	Mode	
*	◇ ∨	
1	Disabled V	
2	Disabled V	
3	Disabled V	
4	Disabled V	

Figure 27 - LLDP Configuration

Label	Description				
LLDP Param	eters				
Tx Interval	The switch periodically transmits <u>LLDP</u> frames to its neighbours for having the networn discovery information up-to-date. The interval between each <u>LLDP</u> frame is determined by the Tx Interval value. Valid values are restricted to 5 - 32768 seconds.				
LLDP Port Configuration					
Port	The switch port number of the logical LLDP port.				
Mode	Select <u>LLDP</u> mode. By default, LLDP is Enabled. Disabled The switch will not send out <u>LLDP</u> information, and will drop <u>LLDP</u> information received from neighbours. Enabled The switch will send out <u>LLDP</u> information, and will analyze <u>LLDP</u> information received from neighbours.				

5.1.16.2 LLDP Neighbor Information

This page provides a status overview for all LLDP neighbors. The following table contains information for each port on which an LLDP neighbor is detected. The columns include the following information:

LLDP Neighbour Information

Auto-refresh 🗌 Refresh

Local Port	Chassis ID	Remote Port ID	System Name	Port Description	System Capabilities	Management Address
Port 7	E8- E8-75-00-27-87	Port.08	iES26G- 1000FX	100TX	Bridge(+)	172.16.26.252 (IPv4) OID: 0.0.0.1.0.0.0.3.0.0.0.6.0.0.0.1.0.0.0.4.0.0.0.1.0.0. 96122.0.0.0.0.0.0.7.0.0.0.18.0.0.0.1.0.0.0.2

Label	Description					
Local Port	The port on which the LLDP frame was received.					
Chassis ID	The Chassis ID is the identification of the neighbour's LLDP frames.					
Remote Port The Remote Port ID is the identification of the neighbour port.						
System	The name advertised by the neighbor.					
Port	The description of the port advertised by the neighbor.					
System Capabilities	 Description of the neighbor's capabilities. The capabilities include: Other Repeater Bridge WLAN Access Point Router Telephone DOCSIS Cable Device Station Only Reserved When a capability is enabled, a (+) will be displayed. If the capability is disabled, a (-) will be displayed. 					
Management Address	Management Address is the neighbour unit's address that is used for higher layer entities to assist discovery by the network management. This could for instance hold the neighbour's IP address.					
Refresh	Click to refresh the page immediately					
Auto-refre sh	Check to enable an automatic refresh. Automatic refresh occurs every 3 seconds.					

Figure 28 - LLDP Neighbor Information

5.1.16.3 **Port Statistics**

This page provides an overview of all LLDP traffic.

Two types of counters are shown. Global Counters are counters that refer to the whole switch, while

Local Counters refer to per port counters for the currently selected switch.

Auto-refresh Clear

LLDP Global Counters

Global Counters					
Neighbour entries were last changed	1970-01-01 00:00:17+00:00 (599 secs. ago)				
Total Neighbours Entries Added	1				
Total Neighbours Entries Deleted	0				
Total Neighbours Entries Dropped	0				
Total Neighbours Entries Aged Out	0				

LLDP Statistics Local Counters

Local Port	Tx Frames	Rx Frames	Rx Errors	Frames Discarded	TLVs Discarded	TLVs Unrecognized	Org. Discarded	Age- Outs
1	0	0	0	0	0	0	0	0
2	0	0	0	0	0	0	0	0
3	0	0	0	0	0	0	0	0
4	0	0	0	0	0	0	0	0
5	0	0	0	0	0	0	0	0
6	0	0	0	0	0	0	0	0
7	22	20	0	0	0	0	0	0

Figure 29 - LLDP Global Counters

5.1.16.3.1 Global Counters

Label	Description
Neighbor entries were last changed at	Shows the time when the last entry was deleted or added. It also shows the time elapsed since the last change was detected.
Total Neighbors Entries Added	Shows the number of new entries added since switch reboot
Total Neighbors Entries Deleted	Shows the number of new entries deleted since switch reboot
Total Neighbors Entries Dropped	Shows the number of LLDP frames dropped due to full entry table
Total Neighbors Entries Aged Out	Shows the number of entries deleted due to expired time-to-live

5.1.16.3.2 Local Counters

Label	Description
Local Port	The port on which LLDP frames are received or transmitted.
Tx Frames	The number of LLDP frames transmitted on the port
Rx Frames	The number of LLDP frames received on the port
Rx Errors	The number of received LLDP frames containing errors
Frames Discarded	If a LLDP frame is received on a port, and the switch's internal table has run full, the LLDP frame is counted and discarded. This situation is known as "Too Many Neighbours" in the LLDP standard. LLDP frames require a new entry in the table when the Chassis ID or Remote Port ID is not already contained within the table. Entries are removed from the table when a given port's link is down, an LLDP shutdown frame is received, or when the entry ages out.
TLVs Discarded	Each LLDP frame can contain multiple pieces of information, known as TLV (Type Length Value). If a TLV is malformed, it will be counted and discarded.
TLVs	The number of well-formed TLVs but with an unknown type value

Label	Description
Org. Discarded	The number of received organizationally TLVs
Age-Outs	Each LLDP frame contains information about how long the LLDP information is valid (age-out time). If no new LLDP frame is received during the age-out time, the LLDP information will be removed, and the value of the age-out counter will be incremented.
Refresh	Click to refresh the page immediately.
Clear	Click to clear the local counters. All counters (including global counters) are cleared upon reboot.
Auto-refresh	Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

5.1.17 Modbus TCP

This page shows Modbus TCP support of the switch. (For more information regarding Modbus, refer to http://www.modbus.org/).

MODBUS Configuration

Mode	Enabled	•
Save	Reset	

Figure 30 - MODBUS Configuration

Label	Description
Mode	Disable or enable Modbus function.
Save	Click to save changes
Reset	Click to undo any changes made locally and revert to previously saved values.

Note: For Modbus commands, see .<u>Appendix A</u>

5.1.18 Backup

This page allows the user to save/view switch configurations.

The configuration file is in XML format with a hierarchy of tags:

Header tags: <?xml version="1.0"?> and <configuration>. These tags are mandatory and must be present at the beginning of the file.

Section tags: <platform>, <global> and <switch>. The platform section must be the first section tag and this section must include the correct platform ID and version. The global section is optional and includes configuration which is not related to specific switch ports. The switch section is optional and includes configuration which is related to specific switch ports.

Module tags: <ip>, <mac>, <port> etc. These tags identify a module controlling specific parts of the configuration.

Group tags: <port_table>, <vlan_table> etc. These tags identify a group of parameters, typically a table.

Parameter tags: <mode>, <entry> etc. These tags identify parameters for the specific section, module

and group. The <entry> tag is used for table entries.

Configuration parameters are represented as attribute values. When saving the configuration from the switch, the entire configuration including syntax descriptions is included in the file. The file may then be modified using an editor and loaded to a switch.

The example below shows a small configuration file only including configuration of the MAC address age time and the learning mode per port. When loading this file, only the included parameters will be changed. This means that the age time will be set to 200 and the learn mode will be set to automatic.

```
<?xml version="1.0"?>
<configuration>
  <platform>
    <pid val="3"></pid>
    <version val="1"></version>
  </platform>
  <global>
    <mac>
      <age val="200"></age>>
    </mac>
  </global>
 <switch sid="1">
    < mac >
      <entry port="1-24" learn mode="auto"></entry>
    </mac>
  </switch>
</configuration>
```

Save Configuration—click to save the configuration file.

Configuration Save

Save Configuration

Figure 31 – Configuration Save

5.1.19 Restore

This page allows the user to load a previously saved configuration to the switch.

Configuration Upload

Browse... No file selected.

Upload

Figure 32 – Configuration Upload

5.1.20 Firmware Update

This page allows the user to update the firmware of the switch. Select the file to be load then press upload. After the software image is uploaded, a page announces that the firmware update is initiated. After about a minute, the firmware is updated and the switch restarts.

Software Upload

Browse... No file selected.

Upload

Figure 33 – Software Upload

Warning: While the firmware is being updated, Web access appears to be defunct. The front LED flashes Green/Off with a frequency of 10 Hz while the firmware update is in progress. Do not restart or power off the device at this time or the switch may fail to function afterwards. Upgrade takes 10 minutes or more based on connection bandwidth.

5.2 DHCP Server/Relay

The switch provides dynamic host configuration protocol (DHCP) server functions. By enabling DHCP, the switch will become a DHCP server. A DHCP server automatically assigns an IP address, subnet mask, domain name server (DNS) address and other pertinent configuration parameters to DHCP client. A DHCP client is the endpoint that receives configuration information from a DHCP server.

5.2.1 Setting

Enable DHCP in this page.

192.168.10.100
192.168.10.200

Figure 34 – DHCP Server Configuration

Label	Description	
Enabled	Enable/Disable DHCP server.	
Start IP Address	The first IP address of IP pool.	
End IP Address	The Last IP address of IP pool.	
Subnet Mask	The subnet mask.	
Router	The IP address of the gateway.	
DNS	The IP address of the Domain Name Server.	
Lease Time	Lease timer counted in seconds.	
TFTP Server	The IP address of the TFTP Sever (Option 66).	
Boot File Name	The name of Boot File (Option 67).	
Save	Click to save changes.	
Reset	Click to undo any changes made locally and revert to previously saved values.	

5.2.2 DHCP Dynamic Client List

When DHCP server functions are activated, the switch will collect DHCP client information and display in the following table.

DHCP Dynamic Client List

No.	Select	Туре	MAC Address	IP Address	Surplus Lease

Select/Clear All Add to static Table

Figure 35 – DHCP Dynamic Client List

Label	Description
Туре	The type of client (Dynamic or Static).
MAC Address	The MAC Address of client.
IP Address	The IP address of client.
Surplus Lease	The surplus Lease time.
Select/Clear All	Select or Clear all check boxes.
Add to Static Table	Add dynamic entry to static table.

5.2.3 DHCP Static Client List

DHCP server can automatically assign an IP address to DHCP client.

DHCP Client List

MAC Address IP Address				
Add as Static				
No. Select	Туре	MAC Address	IP Address	Surplus Lease
Delete Select/Clear All				

Figure 36 – DHCP Static Client List

Label	Description
MAC Address	The MAC Address of client.
IP Address	The IP address of client
Surplus Lease	The surplus Lease time. The length of time for which a DHCP client holds the IP address information. When a lease expires, the client must renew it
Add as Static	Add dynamic entry to static table.
Туре	The type of client (Dynamic or Static).
Delete	Delete selected entry.
Select/Clear All	Select or Clear all check boxes.

5.2.4 DHCP Relay Agent

Configure DHCP Relay on this page..

5.2.4.1 Relay

DHCP Relay Configuration

Relay Mode	Disabled •
Relay Server	0.0.0
Relay Information Mode	Enabled v
Relay Information Policy	Replace 🔻

Save Reset

Figure 37	– DHCP	Relay	Configuration
			2

Label	Description
Relay Mode	Indicates the existing DHCP relay mode. The modes include: Enabled : Enable DHCP relay mode operation. When DHCP relay mode operation is enabled, the agent forwards and transfers DHCP messages between the clients and the server when they are not in the same subnet domain. And the DHCP broadcast message won't be flooded for security considerations. Disabled : Disable DHCP relay mode operation
Relay Server	Indicates the DHCP relay server IP address. A DHCP relay agent is used to forward and transfer DHCP messages between the client and the server when they are not in the same subnet domain.
Relay Information Mode	Indicates the existing DHCP relay information mode. The format of DHCP option 82 circuit ID format is "[vlan_id][module_id][port_no]". The first four characters represent the VLAN ID, the fifth and sixth characters are the module ID. In stand- alone devices, the module ID always equals to 0; in stacked devices, it means switch ID. The last two characters are the port number. For example, "00030108" means the DHCP message received form VLAN ID 3, switch ID 1, and port No. 8. The option 82 remote ID value equals to the switch MAC address. The mode include: Enabled : activate DHCP relay information. When DHCP relay information is enabled, the agent inserts specific information (option 82) into a DHCP message when forwarding to a DHCP server, and removes it from a DHCP message when transferring to a DHCP client. It only works when the DHCP relay mode is enabled. Disabled : disable DHCP relay information
Relay Information Policy	 Indicates the policies to be enforced when receiving DHCP relay information. When DHCP relay information mode is enabled, if the agent receives a DHCP message that already contains relay agent information, it will enforce the policy. The Replace option is invalid when relay information mode is disabled. The policy includes: Replace: replace the original relay information when a DHCP message containing the information is received. Keep: keep the original relay information when a DHCP message containing the information is received. Drop: drop the package when a DHCP message containing the information is received.
Save	Click to save changes
Reset	Click to undo any changes made locally and revert to previously saved values.

5.2.4.2 Relay Statistics

This page provides statistics for DHCP relay.

DHCP Relay Statistics

Server Statistics

Transmit	Transmit	Receive	Receive Missing	Receive Missing	Receive Missing	Receive Bad	Receive Bad
to Server	Error	from Server	Agent Option	Circuit ID	Remote ID	Circuit ID	Remote ID
0	0	0	0	0	0	0	0

Figure 38 – DHCP Relay Statistics

Label	Description				
Transmit to Sever	The number of packets relayed from the client to the server				
Transmit Error	The number of packets with errors when being sent to clients				
Receive from Server	The number of packets received from the server				
Receive Missing Agent Option	The number of packets received without agent information				
Receive Missing Circuit ID	The number of packets received with Circuit ID				
Receive Missing Remote ID	The number of packets received with the Remote ID option missing.				
Receive Bad Circuit ID	The number of packets whose Circuit ID do not match the known circuit ID				
Receive Bad Remote ID	The number of packets whose Remote ID do not match the known Remote ID				

Client Statistics

Transmit	Transmit	Receive	Receive	Replace	Keep	Drop
to Client	Error	from Client	Agent Option	Agent Option	Agent Option	Agent Option
0	0	0	0	0	0	0

Figure 39 – Client Statistics

Label	Description
Transmit to Client	The number of packets relayed from the server to the client
Transmit Error	The number of packets with errors when being sent to servers
Receive from Client	The number of packets received from the server
Receive Agent Option	The number of received packets with relay agent information option.
Replace Agent Option	The number of packets replaced when received messages contain relay agent information.
Keep Agent Option	The number of packets whose relay agent information is retained
Drop Agent Option	The number of packets dropped when received messages contain relay agent information.
Auto-refresh 🔽 :	Auto-refresh Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.
Refresh	Click to refresh the page immediately.
Clear	Clear all statistics.

5.3 Port Setting

Port Setting allows managing of individual ports of the switch, including traffic, power, and trunks.

5.3.1 Port Control

This page shows current port configurations. Ports can also be configured here.

Port Configuration

Save Reset

Label	Description					
Port	This is the logical port number for this row.					
Link	The current link state is shown by different colors. Green indicates the link is up and red means that is down.					
Current Link	Indicates the current link speed of the port					
Configured Link Speed	 Selects any available link speed for the given switch port. Only speeds supported by the specific port is shown. Possible speeds are: Disabled—Disables the switch port operation. Auto— Port auto negotiating speed with the link partner and selects the highest speed that is compatible with the link partner. 10Mbps HDX—Forces the cu port in 10Mbps half duplex mode. 10Mbps FDX—Forces the cu port in 10Mbps full duplex mode. 100Mbps FDX—Forces the cu port in 100Mbps full duplex mode. 100Mbps FDX—Forces the cu port in 100Mbps full duplex mode. 100Mbps FDX—Forces the cu port in 100Mbps full duplex mode. 100Mbps FDX—Forces the cu port in 100Mbps full duplex mode. 100Mbps FDX—Forces the port in 1Gbps full duplex SFP_Auto_AMS - Automatically determines the speed of the SFP. Note: There is no standardized way to do SFP auto detect, so here it is done by reading the SFP rom. Due to the missing standardized way of doing SFP auto detect some SFPs might not be detectable. The port is set in AMS mode with SFP preferred. Cu port is set in Auto mode. 100-FX - SFP port in 100-FX speed. Copper port disabled. 100-FX AMS - Port in AMS mode with SFP preferred. SFP port in 100-FX speed. 100-X_AMS - Port in AMS mode with SFP preferred. SFP port in 100-FX speed. 					
Flow Control	When Auto Speed is selected on a port, this section indicates the flow control capability that is advertised to the link partner. When a fixed-speed setting is selected, that is what is used. The Current Rx column indicates whether pause frames on the port are obeyed, and the Current Tx column indicates whether pause frames on the port are transmitted. The Rx and Tx settings are determined by the result of the last <u>Auto-Negotiation</u> . Check the Configured column to use flow control. This setting is related to the setting for Configured Link Speed.					
Maximum Erromo Sino	Enter the maximum frame size allowed for the switch port, including Frame Check					
Power Control	The Usage column shows the current percentage of the power consumption per port. The Configured column allows for changing the power savings mode parameters per port. Disabled : All power savings mechanisms disabled. ActiPHY : Link down power savings enabled. PerfectReach : Link up power savings enabled. Enabled: Both link up and link down power savings enabled.					
Refresh	Click to refresh the page immediately.					
Save	Click to save changes.					
Reset	Click to undo any changes made locally and revert to previously saved values.					

5.3.2 Port Trunk

5.3.2.1 Configuration

This page is used to configure the static link aggregation hash mode and the aggregation group.

Aggregation Mode Configuration

Hash Code Contribute	ors
Source MAC Address	<
Destination MAC Address	
IP Address	✓
TCP/UDP Port Number	✓

Figure 41 - Aggregation Mode Configuration

Label	Description					
Source MAC Address	The Source MAC address can be used to calculate the destination port for the frame. Check to enable the use of the Source MAC address, or uncheck to disable. By default, Source MAC Address is enabled.					
Destination MAC Address	The Destination MAC Address can be used to calculate the destination port for the frame. Check to enable the use of the Destination MAC Address , or uncheck to disable. By default, Destination MAC Address is disabled.					
IP Address	The IP address can be used to calculate the destination port for the frame. Check to enable the use of the IP Address , or uncheck to disable. By default, I P Address is enabled.					
TCP/UDP Port Number	The TCP/UDP Port Number can be used to calculate the destination port for the frame. Check to enable the use of the TCP/UDP Port Number , or uncheck to disable. By default, TCP/UDP Port Number is enabled.

5.3.2.2 LACP Port

The Link Aggregation Control Protocol (LACP), an IEEE 802.3ad standard protocol, allows bundling several physical ports together to form a single logical port. Note that LACP and Static aggregation can't be both enabled on the same ports.

This page allows the user to inspect the current <u>LACP</u> port configurations, and possibly change them as well.

Port	LACP Enabled	Key	Role
*		◇ ∨	<

18		Auto 🗸	Active ~
19		Auto 🗸	Active ~

LACP Port Configuration

Figure 43 – LACP Port Configuration

Label	Description
Port	The switch port number.
LACP Enabled	Controls whether LACP is enabled on this switch port. LACP will form an aggregation when 2 or more ports are connected to the same partner. Up to 32 aggregations are supported (if stackable).
Key	The Key value varies with the port, ranging from 1 to 65535. Auto will set the key according to the physical link speed $(10Mb = 1, 100Mb = 2, 1Gb = 3)$. Specific allows the user to enter a user-defined value. Ports with the same key value can join in the same aggregation group, while ports with different keys cannot.
Role	Indicates LACP activity status. Active will transmit LACP packets every second; while Passive will wait for a LACP packet from a partner (speak if spoken to).
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.

5.3.2.3 LACP System Status

This page provides a status overview for all LACP instances.

LACP System Status

6		0		0	0	0	
7		0		0	0	0	

Figure 46 - LACP Statistics

Label Description		
Port Switch port number.		
LACP Received The number of LACP frames received at each port.		
LACP Transmitted The number of LACP frames sent from each port.		
Discarded	The number of unknown or illegal LACP frames discarded at each port.	
Refresh Click to refresh the page immediately.		
Auto-refresh	Check to enable an automatic refresh of the page at regular intervals.	
Clear Click to clear the counters for all ports.		

5.3.3 Loop Protection

Loop protection increases the efficiency of STP, RSTP, and MSTP by preventing ports from moving into a forwarding state that would result in a loop opening up in the network.

This page allows the user to inspect the current Loop Protection configurations, and possibly change them as well.

Configuration	
Disable 🔻	
5	seconds
180	seconds
	Configuration Disable ▼ 5 180

Figure 47 – Loop Protection

Label	Description
Enable Loop Protection	Controls whether loop protections is enabled (as a whole).
Transmission Time	The interval between each loop protection PDU sent to each port. The value must be between 1 to 10 seconds.
Shutdown Time	The period (in seconds) for which a port will be kept disabled when a loop is detected (shutting down the port). The valid value is 0 to 604800 seconds (7 days). A value of zero will keep a port disabled permanently (until the device is restarted).

Port Co	nfiguration				
Port	Enable	Action		Tx Mode	9

2nd Ring Port	Port 8 🗸				

Save

Figure 49 - iRing Configuration

Label	Description
iRing	Check to enable iRing topology.
	Only one ring master is allowed in a ring. However, if more than
	one switch is set to enable Ring Master , the switch with the lowest MAC
Ring Master	address will be the active ring master and the others will be backup
	masters.
1 st Ring Port	The primary ring port
2 nd Ring Port	The backup ring port
-	Check to enable Coupling Ring. Coupling Ring can divide a big ring
	into two smaller rings to avoid network topology changes affecting all
Coupling Ring	switches. It is a good method for connecting two rings.
	Used for connecting multiple rings. A coupling ring needs four
Coupling Port	switches to build an active and a backup link. Links formed by the
	coupling ports will run in active/backup mode.
	Check to enable Dual Homing . When Dual Homing is enabled, the
	ring will be connected to normal switches through two RSTP links
Dual Homing	(e.g., a backbone switch). The two links work in active/backup
	mode, and connect each ring to the normal switches in RSTP mode.
Save	Click to apply the configurations.

5.4.2 iChain

iChain is an easy use and powerful network redundancy protocol. The recovery speed of iChain is very quickly. It provides the add-on network redundancy topology for any backbone network, the upper LAN could be iRing, iBridge, RSTP, Single Switch, or any backbone.

iChain Configuration				
E	nable			
	Uplink Port	Edge Port	State	
1st	Port 1 🗸 🗸		LinkDown	
2nd	Port 2 🗸 🗸		LinkDown	

Figure 50 - iChain Configuration

Label	Description
Enable	Check to enable iChain function
Uplink Port	There are two uplink ports for every devices in the chain. The user must specify the ports according to topology of network.
Edge Port	Only the edge (head or tail) device needs to specify edge port. The user must specify the edge port according to topology of network.
State	There three states for uplink port: Link Down, Blocking, and Forwarding.
Save	Click to apply the configurations.
Refresh	Click to refresh the page immediately.

Save	Click to apply the configurations.	

5.4.4 **RSTP**

The Rapid Spanning Tree Protocol (RSTP) is an evolution of the Spanning Tree Protocol (STP). It provides faster convergence of spanning tree after a topology change. The system also supports STP and will detect a connected device that is running STP or RSTP protocol automatically. RSTP is enabled by default. This page allows a user to configure STP system settings. The settings are used by all STP Bridge instances in the switch.

5.4.4.1 RSTP Bridge Setting

The RSTP function can be disabled, STP or RSTP and parameters set for each port via the RSTP Setting interface.

Mode	Disable 👻
Bridge Priority	32768 👻
Max Age	20
Hello Time	2
Forward Delay	15

RSTP Bridge Setting

Save

Figure 52 - RSTP Bridge Setting interface

The following table describes the labels for the RSTP Setting screen.

Label	Description
Mode	The RSTP function must be enabled or disabled before configuring any of
	the related parameters. Valid values are Disable , STP , and RSTP .
Bridge Priority (0-	Controls the bridge priority. Lower numeric values have better priority.
61440)	The bridge priority plus the Multiple Spanning Tree Instances (MSTI)
	number, concatenated with the 6-byte MAC address of the switch forms
	a Bridge Identifier.
	For MSTP operation, this is the priority of the CIST. Otherwise, this is the
	priority of the STP/RSTP bridge.
Max Age (6-40)	The maximum age of the information transmitted by the Bridge when it is
	the Root Bridge. Valid values are in the range 6 to 40 seconds, and
	MaxAge must be <= (FwdDelay-1)*2
Hello Time (1-10)	The time that the Control Switch sends out the BPDU (Bridge Protocol Data
	Unit) packet to verify the current status of RSTP. Enter a value between 1
	and 10.
Forwarding Delay	The delay used by STP Bridges to transit Root and Designated Ports to
(4 20)	Forwarding (used in STP compatible mode). Valid values are in the range
(4-30)	4 to 30 seconds.

NOTE: Follow this rule to configure the MAX Age, Hello Time, and Forward Delay Time:

2 x (Forward Delay Time value -1) \geq Max Age value \geq 2 x (Hello Time value +1)

5.4.4.2 RSTP Port Setting

This page allows the user to configure the current RSTP port configurations, and change them as well. This page contains settings for physical and <u>aggregated</u> ports.

RSTP Port Setting

Figure 53 - RSTP Port Setting

Label	Description		
Port	The switch port number of the logical RSTP port		
Enabled	It shows whether RSTP is enabled on this switch port.		
Path Cost	The Auto setting will set the path cost as appropriate by the physical link speed, using the 802.1D 2004 recommended values.		
	Using the Specific setting, a user-defined value can be entered.		
	The path cost is used when establishing the active topology of the network. Lower path cost ports are chosen as forwarding ports in favor of higher path cost ports. Valid values are in the range 1 to 200000000.		
Priority (0-240)	Enter which port should be blocked by setting the priority on the LAN. Enter a number between 0 and 240. The value of priority must be a multiple of 16.		
Admin Edge	Admin Edge is the port which is directly connected to end stations. Controls whether the <i>operEdge</i> flag should start as set or cleared. (The initial <i>operEdge</i> state when a port is initialized).		
Auto Edge	Controls whether the bridge should enable automatic edge detection on the bridge port. This allows <i>operEdge</i> to be derived from whether BPDU's are received on the port or not.		

Label	Description
Admin P2P	Controls whether the port connects to a point-to-point LAN rather than to a shared medium. This can be automatically determined, or forced either true or false. Transition to the forwarding state is faster for point-to-point LANs than for shared media.
Save	Click to apply the configurations.
Reset	Click to undo any changes made locally and revert to previously saved values.

Figure 55 - RSTP Port Status

Label	Description						
Auto-refresh	Check this box to enable an automatic refresh of the page at regular intervals.						
Refresh	Click to refresh the page immediately.						
Port	The switch port number of the logical RSTP port						
Enabled	It shows whether RSTP is enabled or disabled on this switch port.						
Port Priority	Which ports should be blocked by priority in LAN. A number 0 through 240.						
	The value of priority must be the multiple of 16.						
Path Cost	The cost of the path to the other bridge from this transmitting bridge at the						
	specified port. A number 1 through 200000000.						
OperEdge	When True , OperEdge is enabled, the port is configured as an edge port and						
	directly connected to an end station and cannot create a bridging loop. False						
	means that OperEdge is disabled.						
OperP2P	Some of the rapid state transactions that are possible within RSTP are						
	dependent upon whether the port concerned can only be connected to exactly						
	one other bridge (i.e. It is served by a point-to-point LAN segment), or it can						
	be connected to two or more bridges (i.e. It is served by a shared medium LAN						
	segment).						
	OperP2P shows the P2P status of the link to be manipulated administratively.						
	True means P2P enabling.						
	False means P2P disabling.						
Role	The Role of each port is Disabled or Designated.						
State	The State of each port is Discarding or Forwarding.						

5.4.5 **MSTP**

5.4.5.1 Bridge Settings

This page allows the user to configure STP system settings. The settings are used by all STP Bridge instances in the switch.

STP Bridge Configuration

Basic Settings		
Protocol Version	MSTP 🗸]
Bridge Priority	32768 🗸	
Forward Delay	15	
Max Age	20	
Maximum Hop Count	20	
Transmit Hold Count	6	
Advanced Settings		
Edge Port BPDU Filter	ing 🗌	
Edge Port BPDU Guard	i 🗆	
Port Error Recovery		
Port Error Recovery Ti	meout	

Save Reset

Figure 56 - STP Bridge Configuration

Label	Description
Protocol Version	The version of the STP protocol. Valid values include STP, RSTP, and MSTP.
Bridge Priority	Controls the bridge priority. Lower numeric values have better priority. The bridge priority plus the MSTI instance number, concatenated with the 6-byte MAC address of the switch forms a <i>Bridge Identifier</i> . For MSTP operation, this is the priority of the CIST. Otherwise, this is the priority of the STP/RSTP bridge.
Forward Delay	The delay used by STP bridges to transit root and designated ports to forwarding (used in STP compatible mode). The range of valid values is 4 to 30 seconds.
Max Age	The maximum time the information transmitted by the root bridge is considered valid. The range of valid values is 6 to 40 seconds, and Max Age must be <= (FwdDelay-1)*2.
Maximum Hop Count	This defines the initial value of remaining hops for MSTI information generated at the boundary of an MSTI region. It defines how many bridges a root bridge can distribute its BPDU information. The range of valid values is 4 to 30 seconds, and MaxAge must be <= (FwdDelay-1)*2.
Transmit Hold Count	The number of BPDUs a bridge port can send per second. When exceeded, transmission of the next BPDU will be delayed. The range of valid values is 1 to 10 BPDUs per second.
Advanced Settings	
Edge Port BPDU Filtering	Controls whether a port <i>explicitly</i> configured as Edge will transmit and receive BPDUs.
Edge Port BPDU Guard	Control whether a port <i>explicitly</i> configured as Edge will disable itself upon reception of a BPDU. The port will enter the <i>error-disabled</i> state, and will be removed from the active topology.
Port Error Recovery	Control whether a port in the <i>error-disabled</i> state automatically will be enabled after a certain time. If recovery is not enabled, ports have to be disabled and re- enabled for normal STP operation. The condition is also cleared by a system reboot.

Label	Description
Port Error Recovery Timeout	The time to pass before a port in the <i>error-disabled</i> state can be enabled. Valid values are between 30 and 86400 seconds (24 hours).
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.

5.4.5.2 MSTI Mapping

This page allows the user to inspect the current Multiple Spanning Tree Instances (MSTI) bridge instance priority configurations, and possibly change them as well.

Switches participating in MST instances must be constantly configured with the same MST configuration information. The collection of switches which have the same MST information form an MST region.

Within each MST region, MSTP maintains multiple STIs. Instance 0 is known as IST. All other instances are numbered from 1 to 15. The IST is the only spanning tree instance that sends and receives the MST configuration messages, all other instance information are encapsulated in MST BPDUs. Thus, in MSTP there are two contexts of operation, one in the context of the entire topology called Common and Internal Spanning Tree (CIST), which is the default spanning tree instance for MSTP, and the other in the context of each individual spanning tree context, that is, MSTI. [6]

MSTI Configuration

Add VLANs separated by spaces or comma.

Unmapped VLANs are mapped to the CIST. (The default bridge instance).

Configura	tion Identification	
Configu	ration Name	e8-e8-75-00-11-15

Figure 59 – STP MSTI Port Configuration

Label	Description
Port	The switch port number of the logical STP port
STP Enabled	Check to enable STP for the port
Path Cost	Configures the path cost incurred by the port. Auto will set the path cost according to the physical link speed by using the 802.1D-recommended values. Specific allows the user to enter a user-defined value. The path cost is used when establishing an active topology for the network. Lower path cost ports are chosen as forwarding ports in favor of higher path cost ports. The range of valid values is 1 to 200000000.
Priority	Configures the priority for ports having identical port costs. (See above).

Label	Description								
	Configures the operEdge flag should start as set or cleared.(the initial operEdge								
Admin Edge	stated when a port is initialized).								
Auto Edgo	Check to enable the bridge to detect edges at the bridge port automatically. This								
AutoLuge	allows operEdge to be derived from whether BPDUs are received on the port or not.								
Restricted									
Role	When enabled, the port will not be selected as root port for CIST or any MSTI, even if								
	it has the best spanning tree priority vector. Such a port will be selected as an alternate								
	port after the root port has been selected. If set, spanning trees will lose connectivity.								
	It can be set by a network administrator to prevent bridges outside a core region of								
	the network from influencing the active spanning tree topology because those								
	bridges are not under the full control of the administrator. This feature is also known as								
	Root Guard.								
TCN	When enabled, the port will not propagate received topology change notifications								
	and topology changes to other ports. If set, it will cause temporary disconnection after								
	changes in an active spanning trees topology as a result of persistent incorrectly								
	learned station location information. It is set by a network administrator to prevent								
	bridges outside a core region of the network from causing address flushing in that								
	region because those bridges are not under the full control of the administrator or is								
	the physical link state for the attached LANs transitions frequently.								
BPDU Guard	If enabled, causes the port to disable itself upon receiving valid BPDU's. Contrary to								
	A port entering error-disabled state due to this setting is subject to the bridge Port								
	Error Recovery setting as well.								
Point-to-	Configures whether the port connects to a point-to-point LAN rather than a shared								
Point	medium. This can be configured automatically or set to true or false manually.								
	Transiting to forwarding state is faster for point-to-point LANs than for shared media.

Reset	Click to undo any changes made locally and revert to previously saved values.								

5.4.5.5 MSTI Ports

This page allows the user to inspect the current STP MSTI port configurations, and possibly change them as well.

An MSTI port is a virtual port, which is instantiated separately for each active CIST (physical) port for each MSTI instance configured on and applicable to the port. The MSTI instance must be selected before displaying actual MSTI port configuration options.

This page contains MSTI port settings for physical and aggregated ports.

MSTI Aggregated Ports Configuration								
Port	P	Path Cost						
-	Auto	~	128 ~					
ISTI N	ormal Po	rts Configurati	on					
Port *	F	ath Cost	Priority					
1	Auto		128 ~					
2	Auto	~	128 🗸					
3	Auto	~	128 ~					
4	Auto	~	128 🗸					

MST1 MSTI Port Configuration

Figure 60 – MSTI Port Configuration

Label	Description
Port	The switch port number of the corresponding STP CIST (and MSTI) port
Path Cost	Configures the path cost incurred by the port. Auto will set the path cost according to the physical link speed by using the 802.1D-recommended values. Specific allows the user to enter a user-defined value. The path cost is used when establishing an active topology for the network. Lower path cost ports are chosen as forwarding ports in favor of higher path cost ports. The range of valid values is 1 to 20000000.
Priority	Configures the priority for ports having identical port cost. (See above).
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.

5.4.5.6 Bridge Status

This page shows the status for all STP bridge instances.

5.4.6 MRP

5.4.6.1 Introduction

MRP (Media Redundancy Protocol) is an industry standard for high-availability Ethernet networks. MRP allows Ethernet switches in ring configuration to recover from failure rapidly to ensure seamless data transmission. A MRP ring (IEC 62439) can support up to 50 devices and will enable a back-up link in 80ms (adjustable to max. 200ms/500ms).

5.4.6.2 Configuration

🗹 Enable				
	🗆 Manager 🗆	React on	Link Change	
	1st Ring Port	Port 7 🔻	LinkDown	
	2nd Ring Port	Port 8 🔻	LinkDown	

Apply

Figure 64 - MRP

Label	Description
Enable	Enables the MRP function.
Manager	Every MRP topology needs a MRP manager, and can only have one manager. If two or more switches are set to be Managers at the same time, the MRP topology will fail.
React on Link Change (Advanced mode)	Faster mode. Enabling this function will ensure MRP topology a more rapid converge. This function only can be set by the MRP manager switch.
lst Ring Port	Chooses the port that connects to the MRP ring.
2nd Ring Port	Chooses the port that connects to the MRP ring.

5.4.7 Fast Recovery

Fast Recovery is a function for port redundancy. The port has the highest recovery priority (the lowest number) will be the active port, others will be blocked (if included).

Fast Recovery

Recovery Priority	The port has the highest recovery priority (the lowest number) will be the active port, others will be blocked (if included).
Save	Click to save the configurations.

5.4.8 Dual Port Recovery

Dual Port Recovery mode is defined to work with unmanaged devices/switches or ring of switches. This feature can be set to on single port of switches on both sides of unmanaged ring. The iES22GF with Dual Port Recovery mode will provide redundant links.

5.4.8.1 Introduction

Dual Port Recovery is an iS5 Communication Proprietary solution for interoperability issues with unmanaged devices like unmanaged switches. Dual Port Recovery allows Ethernet switches in ring configuration with unmanaged devices to recover from failure rapidly to ensure seamless data transmission. A dual port recovery ring can support up to 5 unmanaged devices and will enable a back-up link in 40ms (adjustable to min 20ms (recommended is 40ms).

This protocol is based on sending specific messages (BPDU format) from each port on both sides of unmanaged chain. The Dual Port Recovery feature can be executed with other redundancy protocols on same device.

In Dual Port Recovery function if link of port in "Forwarding" state goes down, the "backup" port is changing its state to be forwarding, like in picture below. The disconnected port changes its status to "No Link"

When link of port 1 on switch 2 returns back to be link up, the switch 1 port 1 is in "forwarding" state
and in this case the "No Link" port is changing its status to be "Blocking" port.

5.4.8.2 Configuration

Dual Port Recovery

Enable

Figure 66 – Dual Port Recovery

Label	Description
Enable	Activate the Dual Port Recovery mode.
Active	Choosing the port which connects to the unmanaged switch/ring of switches.
Port	Note: User need to select one port to be Active Port on each of two devices of each side.
Test	Setting Interval time for sending keep alive messages (10-5000 ms default 10)
Interval	Note: Test interval should be the same on both sides.
Test Max	Set the maximum number of lost frames to start Dual Port Recovery mechanism (1-500
Retry	retries default 3)Note: Test Max Retry should be the same on both sides.
Apply	Click Apply to activate the configurations.

5.5 **VLAN**

Refresh |<< >>

5.5.1 VLAN Membership

The <u>VLAN</u> membership configuration for the switch can be monitored and modified here. Up to 4096 VLANs are supported. This page allows for adding and deleting VLAN's as well as adding and deleting port members of each VLAN.

VLAN Membership Configuration

Start from VLAN 1 with 20 entries per page.

			Port Members																			
Delete	VLAN ID	VLAN Name	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
	1	default	\checkmark																			
Add New	VLAN																					
Save	Reset																					

Figure 67 - VLAN Membership Configuration

5.5.1.1 Navigating the VLAN Table

Each page shows up to 99 entries from the VLAN table, with default being 20 as selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the VLAN Table. The first displayed will be the one with the lowest VLAN ID found in the VLAN Table.

The "VLAN" input fields allow the user to select the starting point in the VLAN Table. Clicking **Refresh** will update the displayed table starting from that or the closest next VLAN Table match.

The >> will use the last entry of the currently displayed VLAN entry as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table.

Use **I <<** to start over.

Label	Description
Delete	Check to delete the entry. It will be deleted during the next save.
VLAN ID	Indicates the ID of this particular VLAN.
VLAN Name	Indicates the name of the VLAN. Maximum length of the VLAN Name String is 32. VLAN Name can be null. If it is not null, it must contain alphabets or numbers. At least one alphabet must be present in a non-null VLAN name. VLAN name can be edited for the existing VLAN entries or it can be added to the new entries.

Label	Description
Port Members	A row of check boxes for each port is displayed for each VLAN ID. To include a port in a VLAN, check the box as ✓. To include a port in a forbidden port list, check the box as shown ×. To remove or exclude the port from the VLAN, make sure the box is unchecked as shown ∨. By default, no ports are members, and for every new VLAN entry all boxes are unchecked.
Add New VLAN	Click to add a new VLAN ID. An empty row is added to the table, and the VLAN can be configured as needed. Valid values for a VLAN ID are 1 through 4095. After clicking Save , the new VLAN will be enabled on the selected switch stack but contains no port members. A VLAN without any port members on any stack will be deleted when you click Save. Click Delete to undo the addition of new VLANs.
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.

5.5.2 Ports Configuration

This page is used for configuring the switch port VLAN.

Figure	68 -	VLAN	Port	Configuration
--------	------	------	------	---------------

Label	Description
Ethertype for custom S-Ports	This field specifies the Ether type used for custom S-ports. This is a global setting for all custom S-ports.
Port	This is the logical port number of this row.
Port type	Port can be one of the following types: Unaware , Custom (C-port), Service (S-port), Custom Service (S-custom-port). If port type is Unaware , all frames are classified to the port VLAN ID and tags are not removed.
Ingress Filtering	Enable ingress filtering on a port by checking the box. This parameter affects VLAN ingress processing. If ingress filtering is enabled and the ingress port is not a member of the classified VLAN of the frame, the frame will be discarded. By default, ingress filtering is disabled (no check mark).
Frame Type	Determines whether the port accepts All frames or only Tagged/Untagged frames. This parameter affects VLAN ingress processing. If the port only accepts tagged frames, untagged frames received on the port will be discarded. By default, the field is set to All .
Port VLAN	
Mode	The allowed values are None or Specific . This parameter affects VLAN ingress and egress processing. If None is selected, a VLAN tag with the classified VLAN ID is inserted in frames transmitted on the port. This mode is normally used for ports connected to VLAN-aware switches. Tx tag should be set to Untag_pvid when this mode is used. If Specific (the default value) is selected, a port VLAN ID can be configured (see below). Untagged frames received on the port are classified to the port VLAN ID. If VLAN awareness is disabled, all frames received on the port are classified to the port VLAN ID. If the classified VLAN ID of a frame transmitted on the port is different from the port VLAN ID, a VLAN tag with the classified VLAN ID will be inserted in the frame.
ID	Configures the VLAN identifier for the port. The allowed range of the values is 1 through 4095. The default value is 1. Note: The port must be a member of the same VLAN as the port VLAN ID.
Tx Tag	Determines egress tagging of a port. The Options are: Untag_pvid : all VLANs except the configured PVID will be tagged. Tag_all : all VLANs are tagged. Untag all : all VLANs are untagged.
Port VLAN Mode ID Tx Tag	This parameter affects VLAN ingress processing. If the port only accepts ta frames, untagged frames received on the port will be discarded. By default, the is set to All . The allowed values are None or Specific . This parameter affects VLAN ingress egress processing. If None is selected, a VLAN tag with the classified VLAN ID is inserted in fn transmitted on the port. This mode is normally used for ports connected to V aware switches. Tx tag should be set to Untag_pvid when this mode is used. If Specific (the default value) is selected, a port VLAN ID can be configured below). Untagged frames received on the port are classified to the port VLAN VLAN awareness is disabled, all frames received on the port are classified to the VLAN ID. If the classified VLAN ID of a frame transmitted on the port is different the port VLAN ID, a VLAN tag with the classified VLAN ID will be inserted in the fn Configures the VLAN identifier for the port. The allowed range of the values through 4095. The default value is 1. Note: The port must be a member of the VLAN as the port VLAN ID.

5.5.2.1 Port Types

5.5.3 Private VLAN

This page is used for configuring the private VLAN membership configuration.

5.5.3.1 Private VLAN Membership Configuration

Private VLANs can be added or deleted, and port members of each private VLAN can be added or removed here. Private VLANs are based on the source port mask, and there are no connections to VLANs. This means that VLAN IDs and private VLAN IDs can be identical. A port must be a member of both a VLAN and a private VLAN to be able to forward packets. By default, all ports are VLAN unaware and members of VLAN 1 and private VLAN 1.

5.5.3.2 Port Isolation Configuration

This page is used for enabling or disabling port isolation on ports in a Private VLAN (PVLAN). An isolated port cannot communicate with other ports within the same PVLAN.

A port member of a VLAN can be isolated from other isolated ports on the same VLAN and Private VLAN.

Figure 80 – SNMP System Configuration

Label	Description			
Mode	Indicates existing SNMP mode. Possible modes include:			
	Enabled: enable SNMP mode			
	Disabled: disable SNMP mode			
Version	Indicates the supported SNMP version. Possible versions include:			
	SNMP v1 : supports SNMP version 1.			
	SNMP v2c : supports SNMP version 2c.			
	SNMP v3 : supports SNMP version 3.			
Read Community	Indicates the read community string for permitting access to SNMP agent. The allowed string length is 0 to 255, and only ASCII characters from 33 to 126 are allowed. The field is applicable only when SNMP version is SNMPv1 or SNMPv2c. SNMPv3 uses User-based Security Model (USM) for authentication and privacy, and the community string will be associated with SNMPv3 communities table. It provides more flexibility to configure security name than a SNMPv1 or SNMPv1 or SNMPv2c community string. In addition to community string, a particular range of source addresses can be used to restrict source subnet.			
Write Community	Indicates the write community string to permit access to SNMP agent. The allowed string length is 0 to 255, and only ASCII characters from 33 to 126 are allowed. The field only suits to SNMPv1 and SNMPv2c. SNMPv3 uses USM for authentication and privacy and the community string will be associated with SNMPv3 community table.			
Engine ID	Indicates the SNMPv3 engine ID. The string must contain an even number			
	between 10 and 64 hexadecimal digits, but all-zeros and all-'F's are not			
	allowed. Change of the Engine ID will clear all original local users.			

5.6.1.1 SNMP Trap Configuration

Figure 81 – SNMP Trap Configuration

Label	Description
Trap Mode	Indicates existing SNMP mode operation. Possible modes include: Enabled : enable SNMP trap mode. Disabled : disable SNMP trap mode.
Trap Version	Indicates the supported SNMP trap version. Possible versions include: SNMP v1 : supports SNMP trap version 1 SNMP v2c : supports SNMP trap version 2c SNMP v3 : supports SNMP trap version 3
Trap Community	Indicates the community access string when sending SNMP trap packet. The allowed string length is 0 to 255, and the allowed content is ASCII characters from 33 to 126. community string. In addition to community string, a particular range of source addresses can be used to restrict source subnet.
Trap Destination Address	Indicates the SNMP trap destination address. It allow a valid IP address in dotted decimal notation ('x.y.z.w').
Trap Destination IPv6 Address	Indicates the SNMP trap destination IPv6 address. IPv6 address is in 128-bit records represented as eight fields of up to four hexadecimal digits with a colon separating each field (:). For example, 'fe80::215:c5ff:fe03:4dc7'. The symbol '::' is a special syntax that can be used as a shorthand way of representing multiple 16-bit groups of contiguous zeros; but it can appear only once. It can also represent a legally valid IPv4 address. For example, '::192.1.2.34'.

Label	Description
Trap Authentication Failure	Indicates that the SNMP entity is permitted to generate authentication failure traps. Possible modes are: Enabled: Enable SNMP trap authentication failure. Disabled: Disable SNMP trap authentication failure.
Trap Link-up and Link- downIndicates the SNMP trap link-up and link-down mode operation. Possible mode are: Enabled: Enable SNMP trap link-up and link-down mode operation. Disabled: Disable SNMP trap link-up and link-down mode operation.	
Trap Inform Mode	Indicates the SNMP trap inform mode operation. Possible modes are: Enabled : Enable SNMP trap inform mode operation. Disabled : Disable SNMP trap inform mode operation.
Trap Inform Timeout (seconds)	Indicates the SNMP trap inform timeout. The allowed range is 0 to 2147.
Trap Inform Retry Times	Indicates the SNMP trap inform retry times. The allowed range is 0 to 255.
Trap Probe Security Engine ID	Indicates the SNMP trap probe security engine ID mode of operation. Possible values are: Enabled: Enable SNMP trap probe security engine ID mode of operation. Disabled: Disable SNMP trap probe security engine ID mode of operation.
Trap Security Engine ID	Indicates the SNMP trap security engine ID. SNMPv3 sends traps and informs using USM for authentication and privacy. A unique engine ID for these traps and informs is needed. When Trap Probe Security Engine ID is enabled, the ID will be probed automatically. Otherwise, the ID specified in this field is used. The string must contain an even number(in hexadecimal format) with number of digits between 10 and 64, but all-zeros and all-'F's are not allowed.
Trap Security Name	Indicates the SNMP trap security name. SNMPv3 traps and informs using (user- based security method (USM) for authentication and privacy. A unique security name is needed when traps and informs are enabled.
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.

5.6.2 SNMP Community Configurations

This page allows the user to configure SNMPv3 community table. The entry index key is **Community**.

SNMPv3 Community Configuration

Delete	Community	Source IP	Source Mask	
	public	0.0.0.0	0.0.0	
	private	0.0.0.0	0.0.0.0	
Add New Entry Save Reset				

Label	Description
Delete	Check to delete the entry. It will be deleted during the next save.
Community	Indicates the community access string to permit access to SNMPv3 agent. The
	allowed string length is 1 to 32, and only ASCII characters from 33 to 126 are
	allowed. The community string will be treated as security name and map a
	SNMPv1 or SNMPv2c community string.
Source IP	Indicates the SNMP source address.
Source Mask	Indicates the SNMP source address mask.
Add New Entry	Click to add a new community configuration.
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.

5.6.3 SNMP User Configurations

This page allows the user to configure SNMPv3 user table. The entry index keys are **Engine ID** and **User Name**.

SNMPv3 User Configuration

Delete	Engine ID	User Name	Security Level	Authentication Protocol	Authentication Password	Privacy Protocol	Privacy Password
	800007e5017f000001	default_user	NoAuth, NoPriv	None	None	None	None

Figure 83 – SNMPv3 User Configuration

Label	Description			
Delete	Check to delete the entry. It will be deleted during the next save.			
Delete Engine ID	Check to delete the entry. It will be deleted during the next save. An octet string identifying the engine ID that this entry should belong to. The string must contain an even number(in hexadecimal format) with number of digits between 10 and 64, but all-zeros and all-'F's are not allowed. The SNMPv3 architecture uses the User-based Security Model (USM) for message security and the View-based Access Control Model (VACM) for access control. For the USM entry, the usmUserEngineID and usmUserName are the entry's keys. In a simple agent, usmUserEngineID is always that agent's own snmpEngineID value. The value can also take the value of the snmpEngineID of a remote SNMP engine with which this user can communicate. In other words, if user engine ID equal system engine ID then it is			
	local user; otherwise it's remote user.			
User Name	A string identifying the user name that this entry should belong to. The allowed			

Label	Description
Security Level	Indicates the security model that this entry should belong to. Possible security
	models include:
	NoAuth, NoPriv: no authentication and none privacy
	Auth, NoPriv: Authentication and no privacy
	Auth, Priv: Authentication and privacy
	The value of security level cannot be modified if the entry already exists, which
	means the value must be set correctly at the time of entry creation.
Authentication	Indicates the authentication protocol that this entry should belong to. Possible
Protocol	authentication protocols include:
	None: no authentication protocol
	${f MD5}$: an optional flag to indicate that this user is using MD5 authentication protocol
	SHA: an optional flag to indicate that this user is using SHA authentication protocol
	The value of security level cannot be modified if the entry already exists, which
	means the value must be set correctly at the time of entry creation.
Authentication	A string identifying the authentication pass phrase. For MD5 authentication
Password	protocol, the allowed string length is 8 to 32. For SHA authentication protocol, the
	allowed string length is 8 to 40. Only ASCII characters from 33 to 126 are allowed.
Privacy	Indicates the privacy protocol that this entry should belong to. Possible privacy
Protocol	protocols include:
	None : no privacy protocol
	DES: an optional flag to indicate that this user is using DES authentication protocol
	AES : An optional flag to indicate that this user uses AES authentication protocol.
Privacy	A string identifying the privacy pass phrase. The allowed string length is
Password	8 to 32 and only ASCII characters from 33 to 126 are allowed.

5.6.4 SNMP Group Configurations

This page allows the user to configure SNMPv3 group table. The entry index keys are **Security Model** and **Security Name**.

SNMPv3 Group Configuration

Delete	Security Model	Security Name	Group Name
	v1	public	default_ro_group
	v1	private	default_rw_group
	v2c	public	default_ro_group
	v2c	private	default_rw_group
	usm	default_user	default_rw_group
Add New	Entry Save	Reset	

Figure	84 -	SNMPv3	Group	Configuration
	• •			••••••••

Label	Description
Delete	Check to delete the entry. It will be deleted during the next save.
Security Model	Indicates the security model that this entry should belong to. Possible security models included: v1 : Reserved for SNMPv1. v2c : Reserved for SNMPv2c. usm : User-based Security Model (USM).
Security Name	A string identifying the security name that this entry should belong to. The allowed string length is 1 to 32, and only ASCII characters from 33 to 126 are allowed.
Group Name	A string identifying the group name that this entry should belong to. The allowed string length is 1 to 32, and only ASCII characters from 33 to 126 are allowed.
Add New Entry	Click to add a new group configuration.
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.

5.6.5 SNMP View Configurations

This page allows the user to configure SNMPv3 view table. The entry index keys are **View Name** and **OID Subtree**.

SNMPv3 View Configuration

Delete	View Name	View Type	OID Subtree
	default_view	included 🗸	.1
Add New	Entry Sav	/e Reset	

Label	Description
Delete	Check to delete the entry. It will be deleted during the next save.
View Name	A string identifying the view name that this entry should belong to. The allowed string length is 1 to 32, and only ASCII characters from 33 to 126 are allowed.
View Type	Indicates the view type that this entry should belong to. Possible view types include: Included : an optional flag to indicate that this view subtree should be included. Excluded : An optional flag to indicate that this view subtree should be excluded. Generally, if an entry's view type is Excluded , it should exist in another entry whose view type is Included , and its OID subtree oversteps the Excluded entry.
OID Subtree	The OID defining the root of the subtree to add to the named view. The allowed OID length is 1 to 128. The allowed string content is digital number or asterisk (*).
Add New Entry	Click to add a new view configuration.
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.

5.6.6 SNMP Access Configurations

This page allows the user to configure SNMPv3 access table. The entry index keys are **Group Name**, **Security Model**, and **Security Level**.

SNMPv3 Access Configuration

Delete	Group Name	Security Model	Security Level	Read View Name	Write View Name

	are allowed.			
Security Model	Indicates the security model that this entry should belong to. Possible security			
	models include:			
	any : Accepted any security model ($v1 v2c usm$).			
	vl: Reserved for SNMPvl.			
	v2c: Reserved for SNMPv2c.			
	usm: User-based Security Model (USM).			

Label	Description
Security Level	Indicates the security model that this entry should belong to. Possible security
	models include:
	NoAuth, NoPriv: no authentication and no privacy
	Auth, NoPriv: Authentication and no privacy
	Auth, Priv: Authentication and privacy
Read View Name	The names of the MIB view define the MIB objects for which this request
	may request the current values. The allowed string length is1 to 32, and only
	ASCII characters from 33 to 126 are allowed.
Write View Name	The names of the MIB view defining the MIB objects for which this
	request may potentially SET new values. The allowed string length is 1 to 32, and
	only ASCII characters from 33 to 126 are allowed.
Add New Entry	Click to add a new access configuration.
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.

5.7 Traffic Prioritization

5.7.1 Storm Control

A traffic storm occurs when packets flood the LAN, creating excessive traffic and degrading network performance. Storm Control is a feature which monitors incoming traffic levels over a 1-second traffic storm control interval and, during the interval, compares the traffic level with the configured traffic storm control level. When the ingress traffic reaches the traffic storm control level that is configured on the port, traffic storm control drops the traffic until the interval ends. [10]

There is a unicast storm, multicast storm, and a broadcast storm rate control. These only affect flooded frames, i.e. frames with a (VLAN ID, DMAC) pair not present on the MAC Address table.

Storm control for the switch is configured on this page. The configuration indicates the permitted packet rate for unicast, multicast, or broadcast traffic across the switch.

Note: The Storm Control doesn't function in managed VLAN. For managed VLAN, use ACL (see 5.9.3 ACL) to limit traffic storms.

This page allows the user to configure the storm control settings for all switch ports.

There is a storm rate control for unicast frames, broadcast frames, and unknown (flooded) frames.

Frame Type	Enable	Rate (pps)
Unicast	\checkmark	1 ~
Multicast	\checkmark	1 ~
Broadcast	\checkmark	1 ~

Storm Control Configuration

Figure	87	- QoS	Port	Storm	Control

Label	Description
Frame Type	The settings in a particular row apply to the frame type listed here: Unicast, Multicast or Broadcast.
Rate	The rate unit is packets per second (pps). Valid values are: 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, 1K, 2K, 4K, 8K, 16K, 32K, 64K, 128K, 256K, 512K or 1024K.
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.

5.7.2 Port Classification

Quality of service (QoS) is a method for achieving efficient bandwidth utilization between individual applications or protocols. QoS consists of the following key components:

- Classification—the process of distinguishing one type of traffic from another based upon access control lists (ACLs), Differentiated Services Code Point (DSCP), Class of Service (CoS), and other factors.
- Marking —used on traffic to convey specific information to a downstream device in the network, or

Save

Reset

to carry information from one interface in a device to another. When traffic is marked, QoS operations on that traffic can be applied.

- Shaping and policing— Shaping is the process of imposing a maximum rate of traffic, while regulating the traffic rate in such a way that downstream devices are not subjected to congestion. Shaping in the most common form is used to limit the traffic sent from a physical or logical interface. Policing is used to impose a maximum rate on a traffic class. If the rate is exceeded, then a specific action is taken as soon as the event occurs.
- Queuing used to prevent traffic congestion. Traffic is sent to specific queues for servicing and scheduling based upon bandwidth allocation. Traffic is then scheduled or sent out through the port.
- Bandwidth—bandwidth allocation determines the available capacity for traffic that is subject to QoS policies.
- Trust—enables traffic to pass through the device, and the Differentiated Services Code Point (DSCP), precedence, or CoS values coming in from the end points are retained in the absence of any explicit policy configuration. [9]

This page allows the user to configure the basic QoS Ingress Classification settings for all switch ports.

Port	QoS class	DP level	PCP	DEI	Tag Class.	DSCP Based

me

Label	Description
	Controls the default Drop Precedence (DP) Level. All frames are classified to a DP level.
	If the port is VLAN aware and the frame is tagged, then the frame is classified to a
	DP level that is equal to the DEI value in the tag. Otherwise the frame is classified to the
DP level	default DP level.
	If the port is VLAN aware, the frame is tagged, and Tag Class is enabled. then the frame
	is classified to a DP level that is mapped from the PCP and DEI value in the tag. Otherwise
	the frame is classified to the default DP level.
	The classified DP level can be overruled by a (QoS Control List) QCL entry.
	Controls the default PCP value. <u>PCP</u> is an acronym for <u>Priority C</u> ode <u>Point</u> . It is a 3-bit field storing the priority level for the 802.1Q frame. It is also known as <u>User Priority</u> .
PCP	All frames are classified to a PCP value.
	If the port is VLAN aware and the frame is tagged, then the frame is classified to the
	PCP value in the tag. Otherwise the frame is classified to the default PCP value.
	Controls the default DEI value. <u>DEI</u> is an acronym for <u>D</u> rop <u>E</u> ligible <u>I</u> ndicator. It is a 1-bit field in the VLAN tag.
DEI	All frames are classified to a DEI value.
	If the port is VLAN aware and the frame is tagged, then the frame is classified to the
	DEI value in the tag. Otherwise the frame is classified to the default DEI value.
	Shows the classification mode for tagged frames on this port.
	Disabled : Use default QoS class and DP level for tagged frames.
_ ~	Enabled : Use mapped versions of PCP and DEI for tagged frames.
Tag Class	Click on the mode to configure the mode and/or mapping.
	Note: this setting has no effect if the port is VLAN unaware. Tagged frames received on VLAN-unaware ports are always classified to the default QoS class and DP level.
DSCP Based	Click to enable DSCP Based QoS Ingress Port Classification
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.

5.7.3 Port Tag Remarking

Scheduler Mode	Controls whether the scheduler mode is Strict Priority or weighted on this switch port						
Queue Shaper Enable	Check to enable queue shaper for individual switch ports.						
Queue Shaper Rate	 Configures the rate of each queue shaper. The default value is 500 kbps. This value is restricted to: 100 to 1000000 when the Unit is kbps, and to 1 to 3300 when the Unit is Mbps. 						
Queues Shaper Unit	Configures the rate for each queue shaper. The default value is 500 . This value is restricted to 100 to 1000000 when the Unit is kbps , and it is restricted to 1 to 3300 when the Unit is Mbps .						
Queue Shaper Excess	Allows the queue to use excess bandwidth.						
Port Shaper Enable	Check to enable port shaper for individual switch ports.						
Port Shaper Rate	 Configures the rate of each port shaper. The default value is 500 kbps. This value is restricted to: 100 to 1000000 when the Unit is kbps, and to 1 to 3300 when the Unit is Mbps. 						
Port Shaper Unit	Configures the unit of measurement for each port shaper rate as kbps or M bps . The default unit is kbps .						
Save	Click to save changes.						
Reset	Click to undo any changes made locally and revert to the saved values.						
Cancel	Click to undo any changes made locally and return to the previous page.						

5.7.8.1.2Weighted

In the **Scheduler Mode**, from the drop-down list, select **Weighted**.

Figure 96 - QoS Egress Port Scheduler and Shapers Port 1 – Scheduler Mode Weighted

Label	Description
Scheduler Mode	Controls whether the scheduler mode is Strict Priority or Weighted on this switch port.
Queue Shaper Enable	Check to enable queue shaper for individual switch ports.
Queue Shaper Rate	Configures the rate of each queue shaper. The default value is 500. This value is restricted to 100 to 1000000 when the Unit is kbps, and it is restricted to 1 to 3300 when the Unit is Mbps.
Queues Shaper Unit	Configures the rate of each queue shaper. The default value is 500. This value is restricted to 100 to 1000000 when the Unit" is kbps, and it is restricted to 1 to 3300 when the Unit is Mbps.
Queue Shaper Excess	Allows the queue to use excess bandwidth
Queue Scheduler Weight	Configures the weight of each queue. The default value is 17. This value is restricted to 1 to 100. This parameter is only shown if Scheduler Mode is set to Weighted.
Queue Scheduler Percent	Shows the weight of the queue in percentage. This parameter is only shown if Scheduler Mode is set to Weighted.
Port Shaper Enable	Check to enable port shaper for individual switch ports
Port Shaper Rate	Configures the rate of each port shaper. The default value is 500. This value is restricted to 100 to 1000000 when the Unit is kbps, and it is restricted to 1 to 3300 when the Unit is Mbps.
Port Shaper Unit	Configures the unit of measurement for each port shaper rate as kbps or M bps. The default value is kbps.

11		0 🗸	0 🗸

DSCP-Based QoS Ingress Classification

Figure 97 - QoS DSCP-Based QoS Ingress Classification

Label	Description
DSCP	Maximum number of supported DSCP values is 64
Trust	Controls whether a specific DSCP value is trusted. Only frames with trusted DSCP values are mapped to a specific <u>OoS class</u> and Drop Precedence Level (DP level). DP level —Every incoming frame is classified to a DP level, which is used throughout the device for providing congestion control guarantees to the frame according to what was configured for that specific DP level. Frames with untrusted DSCP values are treated as a non-IP frame.
QoS Class	QoS class value can be any number from 0-7. A QoS class of 0 (zero) has the lowest priority.
DPL	Drop Precedence Level (0-3); a DP level of 0 (zero) corresponds to 'Committed' (Green)
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.

5.7.10 DSCP Translation

To preserve the proper QoS Level of the packet and avoid high priority packets from being delayed or dropped, a DSCP translation policy for traffic can be used. When a DSCP translation policy is enabled, the QoS Level value is converted to a DSCP value according to the specified mapping rules. [8]

This page allows the user to configure basic QoS DSCP translation settings for all switches. DSCP translation can be done in **Ingress** or **Egress**.

Figure 98 - DSCP Translation

Label	Description
DSCP	Maximum number of supported DSCP values is 64. Valid DSCP values are from 0 to 63.
Ingress	Ingress DSCP can be first translated to new DSCP before using the DSCP for QoS class and DPL map. There are two configuration parameters for DSCP Translation: 1. Translate: DSCP can be translated to any of (0-63) DSCP values. 2. Classify: check to enable ingress classification
Egress	The configurable parameters for Egress side are as follows: 1. Remap DP0 —controls the remapping for frames with DP level 0. Select the DSCP value from select menu to which you want to remap. DSCP value ranges form 0 to 63. 2. Remap DP1 —controls the remapping for frames with DP level 1. Select the DSCP value from select menu to which you want to remap. DSCP value ranges form 0 to 63.
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.

Figure 100 - QoS Control List Configuration

Label	Description
Port Members	Check to include the port in the QCL entry. By default, all ports are included.
Key Parameters	Key configurations include:
	Tag: value of tag, can be Any , Untag or Tag .
	VID: valid value of VLAN ID, can be any value from 1 to 4095 or Any, a
	specific value (Specific) or a Range of VIDs.
	PCP: Priority Code Point, can be specific numbers (0, 1, 2, 3, 4, 5, 6,
	7), a range (0-1, 2-3, 4-5, 6-7, 0-3, 4-7) or Any
	DEI : Drop Eligible Indicator, can be 0 , 1 , or Any
	SMAC: Source MAC Address, can be specific (xx-xx-xx, 24 MS bits OUI) or Any
	DMAC Type: Destination MAC type, can be unicast (UC), multicast
	(MC), broadcast (BC) or Any
	Frame Type can be values such as Any, Ethernet, LLC, SNAP, IPv4, IPv6

Label	Description
Frame Type	
Any	Allow all types of frames
Ethernet	Valid Ethernet values can range from 0x600 to 0xFFFF or Any' but excluding
	0x800(IPv4) and 0x86DD(IPv6). The default value is Any.
LLC	SSAP Address: valid SSAP (Source Service Access Point) values can range from
	0x00 to 0xFF or Any. The default value is Any.
	DSAP Address: valid DSAP (Destination Service Access Point) values can range
	from 0x00 to 0xFF or Any. The default value is Any.
	Control Valid Control: valid values can range from 0x00 to 0xFF or
	Any. The default value is Any.
SNAP	PID : valid PID (aka ethernet type) values can range from 0x00 to
	0xFFFF or Any. The default value is Any.
	Protocol IP Protocol Number: (0-255, TCP or UDP) or Any
	Source IP: specific Source IP address in value/mask format or Any. IP and mask
IPv4	are in the format of x.y.z.w where x, y, z, and ware decimal numbers between 0
	and 255. When the mask is converted to a 32-bit binary string and read from
	left to right, all bits following the first zero must also be zero.
	IP Fragmen t: Ipv4 frame fragmented options include 'yes', 'no', and
	'any'.
	DSCP (Differentiated Code Point): can be a specific value, a range, or
	Any. DSCP values are in the range 0-63 including BE, CS1-CS7, EF
-	Protocol IP protocol number: Other (0-255), TCP, UDP, or Any
	Source IP IPVo source address: (a.b.c.d) or Any, 32 L5 bits
IFV0	DSCP (Differentiated Code Point): can be a specific value, a range, or Any.
	DSCP values are in the range 0-63 including BE, CSI-CSI, EF of AFTI-AF43.
	Class QoS class: (0-7) or Default
	Valid Drop Precedence Level value can be (0-3) or Default.
Action	Valid DSCP value can be (0-63, BE, CS1-CS7, EF or AF11-AF43) or
Parameters	Default.
	Default means that the default classified value is not modified by this QCE.
5.7.13 **QoS Statistics**

This page provides the statistics of individual queues for all switch ports.

Figure 102 - Detailed Port Statistics Port 7

5.7.14 QCL Status

This page shows the QoS Control List (QCL) status by different QCL users. Each row describes the QCE that is defined. It is a conflict if a specific QCE is not applied to the hardware due to hardware limitations. The maximum number of QCEs is 256 on each switch.

QoS Control List Status

	Heen	005#	France Trene	Dent		Action	1	Conflict
User	QCE#	LE# Frame Type	POL	Class	DPL	DSCP	Conflict	
No entries								

Label	Description
User	Indicates the QCL user.
QCE#	Indicates the index of QCE.
Frame Type	Indicates the type of frame to look for incoming frames. Possible frame types are:
	Any : the QCE will match all frame type.
	Ethernet : Only Ethernet frames (with Ether Type 0x600-0xFFFF) are allowed.
	LLC: Only (LLC) frames are allowed.
	SNAP : Only (SNAP) frames are allowed.
	IPv4 : the QCE will match only IPV4 frames.
	IPv6: the QCE will match only IPV6 frames.
Port	Indicates the list of ports configured with the QCE.
Action	Indicates the classification action taken on ingress frame if parameters configured
	are matched with the frame's content.
	There are three action fields: Class , DPL , and DSCP .
	Class: Classified QoS; if a frame matches the QCE, it will be put in the queue.
	DPL : Drop Precedence Level; if a frame matches the QCE, then DP level will be set to
	a value displayed under DPL column.
	DSCP : if a frame matches the QCE, then DSCP will be classified with the value
	displayed under DSCP column.
Conflict	Displays the conflict status of QCL entries. As hardware resources are shared by
	multiple applications, resources required to add a QCE may not be available. In that
	case, it shows conflict status as Yes , otherwise it is always No . Please note that conflict
	can be resolved by releasing the hardware resources required to add the QCL entry
	by pressing Resolve Conflict button.

Figure 103 - QoS Control List Status

Label	Description
	Select one of the following to be displayed:
QCL status	Combined: Show both static and conflict entries.
	Static: Show static entries.
	Conflict: Show conflict entries.
Clear	Clear all statistics counters.
Auto- refresh	Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.
Refresh	Click to refresh the page.

5.8 Multicast

5.8.1 IGMP Snooping Basic Configuration

This page provides IGMP Snooping related configurations.

IGMP Snooping Configuration

Global Configuration	
Snooping Enabled	
Unregistered IPMCv4 Flooding Enabled	✓

Port Related Configuration

Port	Router Port	Fast Leave
*		
1		
2		
3		
4		
5		
6		
7		
8		
9		

Label	Description
Snooping Enabled	Check to enable global IGMP snooping
Unregistered	Check to enable unregistered IPv4 MultiCast (IPMCv4) traffic flooding. The
IPMCv4 Flooding	flooding control takes effect only when IGMP Snooping is enabled. When IGMP
enabled	Snooping is disabled, unregistered IPMCv4 traffic flooding is always active in
	spite of this setting.
Router Port	Specifies which ports act as router ports. A router port is a port on the Ethernet
	switch that leads towards the Layer 3 multicast device or IGMP querier.
	If an aggregation member port is selected as a router port, the whole aggregation
	will act as a router port.
Fast Leave	Check to enable fast leave on the port
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.

5.8.2 IGMP Snooping VLAN Configurations

Each page shows up to 99 entries from the VLAN table, with a default value of 20, selected by the **Entries Per Page** input field. When first visited, the web page will show the first 20 entries from the beginning of the VLAN Table. The first displayed will be the one with the lowest VLAN ID found in the VLAN Table.

The **VLAN** input field allows the user to select the starting point in the VLAN Table. Clicking the **Refresh** button will update the displayed table starting from that or the next closest VLAN Table match.

The >> will use the last entry of the currently displayed entry as a basis for the next lookup. When the end is reached, the text **No more entries** is shown in the displayed table. Use the

|<< button to start over.</pre>

Router Port	Port number on the switch.
Router Port Status	Indicates whether a specific port is a router port or not

5.8.4 IGMP Snooping Group Information

Entries in the IGMP Group Table are shown on this page. The IGMP Group Table is sorted first by VLAN ID, and then by group.

Each page shows up to 99 entries from the IGMP Group table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the IGMP Group Table.

The **Start from VLAN** and **group** input fields allow the user to select the starting point in the IGMP Group Table. Clicking **Refresh** will update the displayed table starting from that or the next closest IGMP Group Table match. In addition, the two input fields will—upon clicking **Refresh**—assume the value of the first displayed entry, allowing for continuous refresh with the same start address.

The >> button will use the last entry of the currently displayed table as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table.

Use the | << button to start over.

Delete	Any 🗸	0.0.00	\checkmark	\checkmark	K

Add new entry Save Reset

Figure 108 - Remote Control Security Configuration

Label	Description
Delete	Check to delete the entry. The designated entry will be deleted during the next save.
Port	Port number of the device connecting to remote client. The options are Any or Port 1 , Port2 , etc.
IP	IP address of remote client. Keep this field "0.0.0.0" —it means "Any IP".
Web	Check this item to enable Web management interface
Telnet	Check this item to enable Telnet management interface.
SNMP	Check this item to enable SNMP management interface.
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.
Add new entry	Click to add a new entry

5.9.2 Device Binding

Device Binding effectively binds the IP/MAC address of the device connected with the switch port. If the IP/MAC address of the connecting device does not match the switch port binding information, the device will be blocked for security. Additionally, the bound device also benefits from a collection of active network traffic protection and maintenance tools — Alive Check, Stream Check, and DoS/DDoS auto-prevention.

This page provides Device Binding related configuration.

Device Binding

Function State	Enable	\sim	
----------------	--------	--------	--

Dort	Modo	Alive	e Check	Strean	1 Check	DDO9	S Prevention	Devi	ce

Figure 109 - Device Binding

Label	Description
Function State	Enable/Disable Device Binding.
Port	Port number of remote client.
Mode	 Indicates the per-port Device Binding operation. Possible modes are: : Disable. Scan: Scan IP/MAC automatically, but no binding function. Binding: Enable binding function. Under this mode, any IP/MAC not matching the entry will not be allowed to access the network. Add a checkmark to make Active Alive Check, Stream Check, and DoS/DDoS auto-prevention. Shutdown: Shutdown of the port (No Link).
Alive Check Active	Enable/Disable Alive Check. When enabled, switch will ping the device continually.
Alive Check Status	 Indicates the Alive Check status. Possible options are: : Disable. Got Reply: Got ping reply from device, that means the device is still alive. Lost Reply: Lost ping reply from device, that means the device might have been not available.
Stream Check Active	Enable/Disable Stream Check. When enabled, switch will detect the stream change(getting low) from device.
Stream Check Status	Indicates the Stream Check status. Possible statuses are: : Disable. Normal: The stream is normal. Low: The stream is getting low.
DDOS Prevention Active	Enable/Disable DDOS Prevention. When enabled, switch will monitor the device for DDOS attack (from device).
DDOS Prevention Status	Indicates the DDOS Prevention status. Possible options are: : Disable. Analysing : Analyse the packet throughput for initialization. Running : Function ready. Attacked : DDOS attack happened.
Save	Click to save changes.

5.9.2.1 Advanced Configurations

5.9.2.1.1Alias IP Address

This page provides Alias IP Address configuration. Some devices might have more than one IP addresses. You could specify the other IP address here.

Alias IP Address

Port	Alias IP Address
1	0.0.0.0
2	0.0.0.0
3	0.0.0.0
4	0.0.0.0
5	0.0.0.0
6	0.0.0.0
7	0.0.0.0

Figure 110 - Alias IP Address

Label	Description
Alias IP Address	Specifies alias IP address. Keep 0.0.0.0 if the device does not have an alias IP address.

5.9.2.1.2 Alive Check

You can use ping commands to check port link status. If port link fails, you can set actions from the list.

Alive Check

Port	Mode	Action	Status
1	T	•	
2	T	 Link Chongo	
3	T	Only Log it

Figure 115 - ACL Ports Configuration

Label	Description			
Port	The logical port for the settings contained in the same row.			
Policy ID	Select the policy to apply to this port. The allowed values are 0 through 255 . The default value is 0.			
Action	Select to Permit or Deny forwarding. The default value is Permit .			
Rate Limiter ID	Select a rate limiter for the port. The allowed values are Disabled or numbers from 1 to 16 . The default value is Disabled.			
Port Redirect	Select which port frames are redirected on. The allowed values are Disabled or specific port number and it can't be set when action is permitted. The default value is Disabled .			
MirrorSpecify the mirror operation of this port. The allowed values are: Enabled: Frames received on the port are mirrored. Disabled: Frames received on the port are not mirrored. The default value is "Disabled".				
Logging	 Specifies the logging operation of the port. The allowed values are: Enabled: frames received on the port are stored in the system log. Disabled: frames received on the port are not logged. The default value is Disabled. Please note that system log memory capacity and logging rate is limited. 			
Shutdown	Specifies the shutdown operation of this port. The allowed values are: Enabled : if a frame is received on the port, the port will be disabled. Disabled : port shut down is disabled. The default value is Disabled .			

Label	Description
State	Specify the state of this port. The allowed values are: Enabled : To re-open ports by changing the volatile port configuration of the ACL user module. Disabled : To close ports by changing the volatile port configuration of the ACL user module. The default value is Enabled .
Counter	Counts the number of frames that match this ACE.
Refresh	Click to refresh the page immediately.
Clear	Clear all statistics counters.
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.

5.9.3.2 Rate Limiter

This page allows the user to configure the rate limiter for the ACL of the switch.

ACL Rate Limiter Configuration

Rate Limiter ID	Rate	Unit

Figure 116 - ACL Rate Limiter Configuration

Label	Description	
Rate Limiter ID	The rate limiter ID for the settings contained in the same row.	
	The allowed values are: 0-3276700 in pps or 0, 100, 200, 300,, 1000000 in	
Kate	kbps.	
Unit	Specify the rate unit. The allowed values are: pps : packets per second. kbps : Kbits per second.	
Save	Click to save changes.	
Reset	Click to undo any changes made locally and revert to previously saved values.	

5.9.3.3 Access Control List

This page shows the Access Control List (ACL), which is made up of the ACEs defined on this switch. Each row describes an ACE that is defined. The maximum number of ACEs is 512 on each switch. Click on the lowest plus sign to add a new ACE to the list. The reserved ACEs used for internal protocol, cannot be edited or deleted, the order sequence cannot be changed and the priority is highest.

	Port 4 🗸 🗸
Mirror	Disabled \sim
Logging	Enabled \sim
Shutdown	Disabled \sim
Counter	0

Figure 119 - ACE Configuration

Label	Description
Ingress Port	Indicates the ingress port to which the ACE will apply.
	Any : the ACE applies to any port
	Port \boldsymbol{n} : the ACE applies to this port number, where \boldsymbol{n} is the number of the switch port.
	Specify the policy number filter for this ACE.
	Any: No policy filter is specified. (policy filter status is "don't-care".)
Policy	Specific: If you want to filter a specific policy with this ACE, choose this value. Two fields
Filter	—policy value and bitmask appear.
	 Policy Value: Enter a range between 0 and 255. Policy Bitmask: Enter a range between 0x0 and 0xff.
	Indicates the frame type for this ACE. These frame types are mutually exclusive.
	Any : any frame can match the ACE.
Frame Type	Ethernet Type: only Ethernet type frames can match the ACE. The IEEE 802.3 describes the value of length/types should be greater than or equal to 1536 decimal (equal to 0600 hexadecimal).
	ARP : only ARP frames can match the ACE. Notice the ARP frames will not match the ACE with Ethernet type.
	IPv4 : only IPv4 frames can match the ACE. Notice the IPv4 frames will not match the ACE with Ethernet type.
	Specifies the action to taken when a frame matches the ACE.
Action	Permit: takes action when the frame matches the ACE.
	Deny: drops the frame matching the ACE.
Rate Limiter	Specifies the rate limiter in number of base units. The allowed range is 1 to 16.
	Disabled means the rate limiter operation is disabled.
Port Redirect	Frames that hit the ACE are redirected to the port number specified here. The allowed range is the same as the switch port number range. Disabled indicates that the port redirect operation is disabled and the specific port number of 'Port Redirect' can't be set when action is permitted.

Label	Description
Mirror	Specify the mirror operation of this port. Frames matching the ACE are mirrored to the destination mirror port. The allowed values are: Enabled : Frames received on the port are mirrored. Disabled : Frames received on the port are not mirrored. The default value is Disabled .
Logging	Specifies the logging operation of the ACE. The allowed values are: Enabled : Frames matching the ACE are stored in the System Log. Disabled : Frames matching the ACE are not logged. Please note that system log memory capacity and logging rate is limited.
Shutdown	Specifies the shutdown operation of the ACE. The allowed values are: Enabled : if a frame matches the ACE, the ingress port will be disabled. Disabled : port shutdown is disabled for the ACE.
Counter	Indicates the number of times the ACE matched by a frame.

5.9.3.3.1 MAC Parameters

MAC Parameters

DMAC Filter Any ~

Figure 120 - MAC Parameters

Label	Description
	Specifies the destination MAC filter for this ACE
	Any : no DMAC filter is specified (DMAC filter status is " don't-care ").
DMAC Filter	MC: frame must be Multicast.
	BC: frame must be Broadcast.
	UC: frame must be Unicast.

5.9.3.3.2 VLAN Parameters

VLAN Parameters

802.1Q Tagged	Any	\sim
VLAN ID Filter	Any	\sim
Tag Priority	Any	\sim

VLAN Parameters

802.1Q Tagged	Enabled ~	
VLAN ID Filter	Specific ~	
VLAN ID	1	
Tag Priority	Any 🗸	

Figure 121 - VLAN Parameters (default values or with Filter "Specific")

Label	Description
802.1Q Tagged	Specify whether frames can hit the action according to the 802.1Q tagged. The allowed values are: Any : Any value is allowed ("don't-care"). Enabled : Tagged frame only. Disabled : Untagged frame only. The default value is Any.

Label	Description
VLAN ID Filter	Specifies the VLAN ID filter for the ACE.
	Any: no VLAN ID filter is specified (VLAN ID filter status is "don't-care").
	Specific : if you want to filter a specific VLAN ID with the ACE, choose this value. A field for entering a VLAN ID number appears.
	When Specific is selected for the VLAN ID filter, the user can enter a specific VLAN ID
VLAN ID	number. The allowed range is 1 to 4095. Frames matching the ACE will use this VLAN ID
	value.
	Specifies the tag priority for the ACE. A frame matching the ACE will
Tag Priority	use this tag priority. The allowed numbers are in the range from 0 to 7
	Any means that no tag priority is specified (tag priority is " don't-care ").

The IP parameters can be configured when Frame Type of IPv4 is selected (see Figure 119 - ACE Configuration).

Label	Description					
IP Protocol	Specifies the IP protocol filter for the ACE					
Filter	Any: no IP protocol filter is specified ("don't-care").					
	Other: if you want to filter a specific IP protocol filter with the ACE, choose this value. A					
	field for entering an IP protocol filter appears. ICMP: selects ICMP to filter IPv4 ICMP protocol frames. Extra fields for defining ICM parameters will appear. For more details of these fields, please refer to the help file.					
	UDP: selects UDP to filter IPv4 UDP protocol frames. Extra fields for defining UDP					
	parameters will appear. For more details of these fields, please refer to the help file.					
	TCP: selects TCP to filter IPv4 TCP protocol frames. Extra fields for defining TCP					
	parameters will appear. For more details of these fields, go to the Help file.					
IP Protocol Value	Other allows the user to enter a specific value. The allowed range is 0 to 255. Frames matching the ACE will use this IP protocol value.					
IP TTL	Specifies the time-to-live (TTL) settings for the ACE					
	Zero: IPv4 frames with a time-to-live value greater than zero must not be able to					
	match this entry.					
	Non-zero: IPv4 frames with a time-to-live field greater than zero must be able to					
	match this entry.					
	Any : any value is allowed (" don't-care ").					
	Specifies the fragment offset settings for the ACE. This includes settings of More Fragments (MF) bit and Fragment Offset (FRAG OFFSET) for an IPv4 frame. No: IPv4 frames whose MF bit is set or the FRAG OFFSET field is greater than zero must					
IP	not be able to match this entry.					
Fragment	Yes: IPv4 frames whose MF bit is set or the FRAG OFFSET field is greater than zero must					
	be able to match this entry.					
	Any: any value is allowed ("don't-care").					
	Specifies the options flag settings for the ACE.					
ID Ontion	No: $IPv4$ frames whose options flag is set must not be able to match this entry.					
IP Option	Yes: IPv4 frames whose options flag is set must be able to match this entry.					
	Any : any value is allowed (" don't-care ").					
	Specifies the source IP (SIP) filter for this ACE.					
	Any: no source IP filter is specified (Source IP filter is "don't-care").					
	Host: source IP filter is set to Host. Specify the source IP address in the SIP Address					
SIP Filter	field that appears.					
	Network : source IP filter is set to Network . Specify the source IP address and source					
	IP mask in the SIP Address and SIP Mask fields that appear.					
SIP Address	When Host or Network is selected for the source IP filter, you can enter a specific SIP address in <u>dotted decimal notation</u> .					

Label	Description			
SIP Mask	When Network is selected for the source IP filter, you can enter a specific SIP mask in dotted decimal notation.			
	Specifies the destination IP filter for the ACE			
	Any: no destination IP filter is specified (destination IP filter is "don't-care").			
	Host: destination IP filter is set to Host. Specify the destination IP address in the DIP			
DIP Filter	Address field that appears.			
	Network: destination IP filter is set to Network. Specify the destination IP address and			
	destination IP mask in the DIP Address and DIP Mask fields that appear.			
DIP Address	When Host or Network is selected for the destination IP filter, you can enter a specific DIP address in dotted decimal notation.			
DIP Mask	When Network is selected for the destination IP filter, you can enter a specific DIP mask in dotted decimal notation.			

5.9.3.3.4 ARP Parameters

The ARP parameters can be configured when Frame Type of ARP is selected (see below).

Label	Description		
	Specifies the available ARP/RARP opcode (OP) flag for the ACE		
ARP/RARP	Any : no ARP/RARP OP flag is specified (OP is " don't-care ").		
	ARP : frame must have ARP/RARP opcode set to ARP		
	RARP : frame must have ARP/RARP opcode set to RARP.		
	Other : frame has unknown ARP/RARP Opcode flag.		
	Specifies the available ARP/RARP opcode (OP) flag for the ACE		
Request/Reply	Any: no ARP/RARP OP flag is specified (OP is "don't-care").		
nequest, nepry	Request : frame must have ARP Request or RARP Request OP flag set.		
	Reply : frame must have ARP Reply or RARP Reply OP flag.		
	Specifies the sender IP filter for the ACE		
	Any : no sender IP filter is specified (sender IP filter is " don't-care ").		
Sender IP Filter	Host : sender IP filter is set to Host . Specify the sender IP address in the SIP Address field that appears.		
	Network : sender IP filter is set to Network . Specify the sender IP address and sender IP mask in the SIP Address and SIP Mask fields that appear.		
Sender IP Address	When Host or Network is selected for the sender IP filter, you can enter a specific sender IP address in dotted decimal notation.		
See Jac ID	When Network is selected for the sender IP filter, you can enter a specific sender IP mask in dotted decimal notation.		
Sender IP Mask	Dotted Decimal Notation refers to a method of writing IP addresses using decimal numbers and dots as separators between octets. An IPv4 dotted decimal address has the form x.y.z.w, where x, y, z, and w are decimal numbers between 0 and 255.		
	Specifies the target IP filter for the specific ACE		
	Any : no target IP filter is specified (target IP filter is " don't-care ").		
Target IP Filter	Host : target IP filter is set to Host . Specify the target IP address in the Target IP Address field that appears.		
1 mei	Network : target IP filter is set to Network . Specify the target IP address and target IP mask in the Target IP Address and Target IP Mask fields that appear.		
Target IP Address	When Host or Network is selected for the target IP filter, you can enter a specific target IP address in dotted decimal notation.		
Target IP Mask	When Network is selected for the target IP filter, you can enter a specific target IP mask in dotted decimal notation.		
	Specifies whether frames will meet the action according to their sender hardware		
	address field (SHA) settings.		
ARP Sender	0 : ARP frames where SHA is not equal to the SMAC address		
MAC Match	1: ARP frames where SHA is equal to the SMAC address		
	Any : any value is allowed (" don't-care ").		

Label	Description				
RARP Target Match	getSpecifies whether frames will meet the action according to their target hardware address field (THA) settings. 0: RARP frames where THA is not equal to the target MAC address 1: RARP frames where THA is equal to the target MAC address 				
IP/Ethernet Length	Specifies whether frames will meet the action according to their ARP/RARP hardware address length (HLN) and protocol address length (PLN) settings. 0 : ARP/RARP frames where the HLN is equal to Ethernet (0x06) and the (PLN) is equal to IPv4 (0x04) must not match this entry. 1 : ARP/RARP frames where the HLN is equal to Ethernet (0x06) and the (PLN) is equal to IPv4 (0x04) must match this entry. Any : any value is allowed (" don't-care ").				
IP	 Specifies whether frames will meet the action according to their ARP/RARP hardware address space (HRD) settings. 0: ARP/RARP frames where the HLD is equal to Ethernet (1) must not match this entry. 1: ARP/RARP frames where the HLD is equal to Ethernet (1) must match this entry. Any: any value is allowed ("don't-care"). 				
Ethernet	Specifies whether frames will meet the action according to their ARP/RARP protocol address space (PRO) settings. 0: ARP/RARP frames where the PRO is equal to IP (0x800) must not match this entry. 1: ARP/RARP frames where the PRO is equal to IP (0x800) must match this entry. Any : any value is allowed (" don't-care ").				

5.9.3.3.5ICMP Parameters

ICMP Parameters can be configured when:

- Frame Type is IPv4
- IP Protocol Filter is Internet Control Message Protocol (ICMP)

IP Parameters

IP Protocol Filter	ICMP	~
IP TTL	Any	~
IP Fragment	Any	~
IP Option	Any	\sim
SIP Filter	Any	\sim
DIP Filter	Any	~

ICMP Parameters

ICMP Type Filter	Specific 🗸
ICMP Type Value	255
ICMP Code Filter	Specific 🗸
ICMP Code Value	255

Label	Description
ICMP Type	Specifies the ICMP filter for the ACE
rmer	Any: no ICMP filter is specified (ICMP filter status is "don't-care").
	Specific : if you want to filter a specific ICMP filter with the ACE, you can enter a specific ICMP value. A field for entering an ICMP value appears.
ICMP Type Value	When Specific is selected for the ICMP filter, you can enter a specific ICMP value. The allowed range is 0 to 255. A frame matching the ACE will use this ICMP value.
ICMP Code	Specifies the ICMP code filter for the ACE
rmer	Any: no ICMP code filter is specified (ICMP code filter status is "don't-care").
	Specific : if you want to filter a specific ICMP code filter with the ACE, you can enter a specific ICMP code value. A field for entering an ICMP code value appears.
ICMP Code Value	When Specific is selected for the ICMP code filter, you can enter a specific ICMP code value. The allowed range is 0 to 255. A frame matching the ACE will use this ICMP code value.

5.9.3.3.6 TCP /UDP Parameters

IP Parameters

IP Protocol Filter	TCP
IP TTL	Any \checkmark
IP Fragment	Any 🗸
IP Option	Any 🗸
SIP Filter	Any 🗸
DIP Filter	Any 🗸

IP Parameters

Source Port Range	0 - 65	535
Dest. Port Filter	Range	\sim
Dest, Port Range	0 - 65	535

Figure 125 - TCP / UDP Parameters

TCP Parameters can be configured when IP Protocol Filter is set to TCP.

Similarly, UDP Parameters can be configured when IP Protocol Filter is set to UDP.

Label	Description					
	Specifies the TCP/UDP source filter for the ACE					
	Any: no TCP/UDP source filter is specified (TCP/UDP source filter status is "don't-					
TCP/UDP	care").					
Source Port	Specific: if you want to filter a specific TCP/UDP source filter with the ACE, you can					
Filter	enter a specific TCP/UDP source value. A field for entering a TCP/UDP source value appears.					
	Range : if you want to filter a specific TCP/UDP source range filter with the ACE, you can enter a specific TCP/UDP source range. A field for entering a TCP/UDP source value appears.					
TCP/UDP	When Specific is selected for the TCP/UDP source filter, you can enter a specific					
Source Port	TCP/UDP source value. The allowed range is 0 to 65535. A frame matching the ACE					
No.	will use this TCP/UDP source value.					
TCP/UDP	When Range is selected for the TCP/UDP source filter, you can enter a specific					
Source	TCP/UDP source range value. The allowed range is 0 to					
Range	65535. A frame matching the ACE will use this TCP/UDP source range.					
	Specifies the TCP/UDP destination filter for the ACE					
	Any: no TCP/UDP destination filter is specified (TCP/UDP destination filter status is					
	"don't-care").					
TCP/UDP	Specific: if you want to filter a specific TCP/UDP destination filter with the ACE, you					
Destination	can enter a specific TCP/UDP destination value. A field for entering a TCP/UDP					
Filter	destination value appears.					
	Range: if you want to filter a specific range TCP/UDP destination filter with the					
	ACE, you can enter a specific TCP/UDP destination range. A field for entering a					
	TCP/UDP destination value appears.					
TCP/UDP	When Specific is selected for the TCP/UDP destination filter, you can enter a specific					
Destination	TCP/UDP destination value. The allowed range is 0 to 65535. A frame matching the					
Number	ACE will use this TCP/UDP destination value.					
	When Range is selected for the TCP/UDP destination filter, you can enter a specific					
TCP/UDP	TCP/UDP destination range value. The allowed range is 0 to 65535. A frame matching					
Destination Range	the ACE will use this TCP/UDP destination range.					
	Specifies the TCP FIN ("no more data from sender") value for the ACE.					
	0 : TCP frames where the FIN field is set must not be able to match this entry.					
TCP FIN	1: TCP frames where the FIN field is set must be able to match this entry.					
	Any : any value is allowed (" don't-care ").					

Label	Description
	Specifies the TCP SYN ("synchronize sequence numbers") value for the ACE
	0 : TCP frames where the SYN field is set must not be able to match this entry.
TCPSIN	1: TCP frames where the SYN field is set must be able to match this entry.
	Any : any value is allowed (" don't-care ").
	Specifies the TCP PSH ("push function") value for the ACE
TCP PSH	0 : TCP frames where the PSH field is set must not be able to match this entry.
101 101	1: TCP frames where the PSH field is set must be able to match this entry.
	Any: any value is allowed ("don't-care").
	Specifies the TCP ACK ("acknowledgment field significant") value for the ACE $\$
	0 : TCP frames where the ACK field is set must not be able to match this entry.
TCPACK	1: TCP frames where the ACK field is set must be able to match this entry.
	Any : any value is allowed (" don't-care ").
	Specifies the TCP URG ("urgent pointer field significant") value for the ACE
TCP URG	0 : TCP frames where the URG field is set must not be able to match this entry.
	1: TCP frames where the URG field is set must be able to match this entry.
	Any : any value is allowed (" don't-care ").

5.9.3.3.7 Ethernet Type Parameters

The Ethernet Type parameters can be configured when Frame Type "Ethernet Type" is selected.

ACE Configuration

Ethernet Type Parameters

Ingress Port	All 🗸]		
Policy Filter	Any ~		EtherType Filter	Specific
Frame Type	Ethernet Type 🗸		Ethernet Type Value	0x FFFF

Figure 126 - Ethernet Type Parameters

Label	Description
EtherType Filter	Specify the Ethernet type filter for this ACE. Any : No EtherType filter is specified (EtherType filter status is "don't-care"). Specific : If you want to filter a specific EtherType filter with this ACE, you can enter a specific EtherType value. A field for entering a EtherType value appears.
Ethernet Type Value	When Specific is selected for the EtherType filter, you can enter a specific EtherType value. The allowed range is 0×600 to $0 \times FFFF$ but excluding 0×800 (IPv4), 0×806 (ARP) and 0×86 DD (IPv6). A frame that hits this ACE matches this EtherType value.

5.9.3.4 ACL Status

This page shows the ACL status by different ACL users. Each row describes the ACE that is defined. It is a conflict if a specific ACE is not applied to the hardware due to hardware limitations. The maximum number of ACEs is 512 on each switch.

Combined V Auto-refresh C Refresh

ACL Status

User	Ingress Port	Frame Type	Action	Rate Limiter	Port Redirect	Mirror	CPU	CPU Once	Counter	Conflict
No entr	ies									

Label	Description
User	Indicates the ACL user.
Ingress Port	Indicates the ingress port to which the ACE will apply. All : the ACE will match all ports. Port n : the ACE applies to this port number, where n is the number of the switch port.
Frame Type	Indicates the frame type of the ACE. Any : The ACE will match any frame type. EType : The ACE will match Ethernet Type frames. Note that an Ethernet Type based ACE will not get matched by IP and ARP frames. ARP : The ACE will match ARP/RARP frames. IPv4 : The ACE will match all IPv4 frames. IPv4/ICMP : The ACE will match IPv4 frames with ICMP protocol. IPv4/UDP : The ACE will match IPv4 frames with UDP protocol. IPv4/TCP : The ACE will match IPv4 frames with TCP protocol. IPv4/TCP : The ACE will match IPv4 frames with TCP protocol. IPv4/Other : The ACE will match IPv4 frames, which are not ICMP/UDP/TCP. IPv6 : The ACE will match all IPv6 standard frames.
Action	Indicates the forwarding action of the ACE. Permit : Frames matching the ACE may be forwarded and learned. Deny : Frames matching the ACE are dropped.
Rate Limiter	Indicates the rate limiter number of the ACE. The allowed range is 1 to 16. When Disabled is displayed, the rate limiter operation is disabled.
Port Redirect	Frames that match the ACE are copied to the port number specified here. The allowed range is the same as the switch port number range. Disabled indicates that the port copy operation is disabled.
Mirror	Specify the mirror operation of this port. The allowed values are: Enabled : Frames received on the port are mirrored. Disabled : Frames received on the port are not mirrored. The default value is Disabled .
CPU	Forwards packet that matches the specific ACE to CPU.
CPU Once	Forwards first packet that matches the specific ACE to CPU.
Counter	The counter indicates the number of times the ACE was hit by a frame.
Conflict	Indicates the hardware status of the specific ACE. The specific ACE is not applied to the hardware due to hardware limitations.

Figure 127 - ACL Status

Label	Description			
	Select one of the following to be displayed:			
Select ACL	 Combined: Shows both static and conflict entries in the ACL. Static: Shows static entries in the ACL. IPMC: Shows IPv4 MultiCast (IPMC)entries in the ACL. DHCP: Shows DHCP entries in the ACL Loop Protect: Shows Loop-protect entries in the ACL. Loop protect feature can prevent Layer2 loops by sending loop protect part themselves. The feature works by checking source MAC addres protect packet against MAC addresses of loop protect enabled in is found, loop protect disables the interface which received the Log message warns about this event and interface is marked comment by system. Conflict: Show conflict entries in the ACL. 	Combined Static IPMC PTP DHCP Loop Protect Conflict	ets om oop tch cet.	
Refresh	Click to refresh the page.			
Auto-refresh	Check to enable an automatic refresh of the page at regular interva	als.		

5.9.4 AAA

5.9.4.1 AAA - Authentication Server Configuration

5.9.4.1.1 Common Server Configuration

This page allows the user to configure the Authentication Servers..

Authentication Server Configuration

Common Server Configuration

Timeout	15	seconds
Dead Time	300	seconds

Figure 128 - Common Server Configuration

Label	Description	
Timeout	The Timeout, which can be set to a number between 3 and 3600 seconds, is the maximum time to wait for a reply from a server. If the server does not reply within this time frame, we will consider it to be dead and continue with the next enabled server (if any). RADIUS servers are using the <u>UDP</u> protocol, which is unreliable by design. In order to cope with lost frames, the timeout interval is divided into 3 subintervals of equal length. If a reply is not received within the subinterval, the request is transmitted again. This algorithm causes the RADIUS server to be queried up to 3 times before it is considered to be dead.	

Label	Description	
Dead Time	The Dead Time, which can be set to a number between 0 and 3600 seconds, is the period during which the switch will not send new requests to a server that has failed to respond to a previous request. This will stop the switch from continually trying to contact a server that it has already determined as dead. Setting the Deadtime to a value greater than 0 (zero) will enable this feature, but only if more than one server has been configured.	

5.9.4.1.2 RADIUS Authentication Server Configuration

The table has one row for each <u>RADIUS</u> Authentication Server and a number of columns, which are:

RADIUS Authentication Server Configuration

#	Enabled	IP Address	Port	Secret
1			1812	
2			1812	
3			1812	
4			1812	
5			1812	

Figure 129 - RADIUS Authentication Server Configuration

Label	Description	
#	The RADIUS Authentication Server number for which the configuration below applies.	
Enabled	Enable the RADIUS Authentication Server by checking this box	
IP Address	The IP address of the RADIUS Authentication Server. IP address is expressed in <u>dotted</u> <u>decimal notation</u> .	
Port	The $\underline{\text{UDP}}$ port to be used on the RADIUS Authentication Server. If the port is set to 0 (zero), the default port (1812) is used on the RADIUS Authentication Server.	
Secret	The secret - up to 29 characters long - shared between the RADIUS Authentication Server and the switch.	

5.9.4.1.3 RADIUS Accounting Server Configuration

The table has one row for each <u>RADIUS</u> Accounting Server and a number of columns, which are:

RADIUS Accounting Server Configuration

#	Enabled	IP Address	Port	Secret
1			1813	
2			1813	
3			1813	
4			1813	
5			1813	

Figure 130 - RADIUS Accounting Server Configuration

Label	Description	
#	The RADIUS Accounting Server number for which the configuration below applies.	
Enabled	Enable the RADIUS Accounting Server by checking this box	
IP Address	The IP address of the RADIUS Authentication Server. IP address is expressed in <u>dotted</u> decimal notation.	

Label	Description
Port	The <u>UDP</u> port to be used on the RADIUS Accounting Server. If the port is set to 0 (zero), the default port (1813) is used on the RADIUS Accounting Server.
Secret	The secret - up to 29 characters long - shared between the RADIUS Authentication Server and the switch.

5.9.4.1.4 TACACS+ Authentication Server Configuration

TACACS+ is an acronym for Terminal Access Controller Access Control System Plus. It is a networking protocol which provides access control for routers, network access servers and other networked computing devices via one or more centralized servers. TACACS+ provides separate authentication, authorization, and accounting services. This switch has TACACS+ authentication server configuration.

TACACS+ Authentication Server Configuration

#	Enabled	IP Address	Port	Secret
1			49	
2			49	
3			49	
4			49	
5			49	

Figure 131 - TACACS+ Authentication Server Configuration

The table has one row for each <u>TACACS+</u> Authentication Server and a number of columns, which are:

Label	Description	
#	The TACACS+ Authentication Server number for which the configuration below applies.	
Enabled	Enable the TACACS+ Authentication Server by checking this box	
IP Address	The IP address of the TACACS+ Authentication Server. IP address is expressed in <u>dotted</u> <u>decimal notation</u> .	
Port	The $\underline{\text{TCP}}$ port to be used on the TACACS+ Authentication Server. If the port is set to 0 (zero), the default port (49) is used on the TACACS+ Authentication Server.	
Secret	The secret - up to 29 characters long - shared between the RADIUS Authentication Server and the switch.	

5.9.4.2 RADIUS Overview

This page provides an overview of the status of the RADIUS servers configurable on the authentication configuration page.

RADIUS Authentication Server Status Overview

Auto-	refresh 🗌 Refresh	
#	IP Address	Status
1	0.0.0.1812	Disabled
2	0.0.0.0:1812	Disabled
3	0.0.0:1812	Disabled
4	0.0.0.1812	Disabled
5	0.0.0.0:1812	Disabled

Figure 132 - Radius Authentication Server Status Configuration

Label	Description
#	The RADIUS server number. Click to navigate to detailed statistics of the server.
IP Addross	The IP address and UDP port number (in <ip address="">: <udp port=""> notation) of the server.</udp></ip>
11uu1 ess	For example, 0.0.0:1812.
	The current status of the server. This field takes one of the following values:
	Disabled: The server is disabled.
	Not Ready: The server is enabled, but IP communication is not yet up and running.
	Ready: The server is enabled, IP communication is up and running, and the RADIUS
Status	module is ready to accept access attempts.
	Dead (X seconds left): Access attempts were made to this server, but it did not reply within
	the configured timeout. The server has temporarily been disabled, but will get re-enabled
	when the dead-time expires. The number of seconds left before this occurs is displayed in
	parentheses. This state is only reachable when more than one server is enabled.
Refresh	Click to refresh the page immediately.
Auto- refresh	Check to enable an automatic refresh of the page at regular intervals.

RADIUS Accounting Server Status Overview

#	IP Address	Status

Figure 134 - Radius Authentication Statistics for Server #1

Label	Description
Server #n \downarrow	The server select drop down box determines which server's information is shown by selecting server $\#n$. Where 'n' is a server, 1 to 5.
Auto-refresh	Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.
Refresh	Click to refresh the page immediately.
Clear	Clears the counters for the selected server. The "Pending Requests" counter will not be cleared by this operation.

Packet Counters: RADIUS authentication server packet counter. There are seven receive and four transmit counters (see below for details).

Rx/Tx	Name	RFC4668 Name [3]	Description		
Rx	Access Accepts	radiusAuthClientExt AccessAccepts	The number of RADIUS Access-Accept packets (valid or invalid) received from the server.		
Rx	Access Rejects	radiusAuthClientExt AccessRejects	The number of RADIUS Access-Reject packets (valid or invalid) received from the server.		
Rx	Access Challenges	radiusAuthClientExt AccessChallenges	The number of RADIUS Access-Challenge packets (valid or invalid) received from the server.		
Rx	Malformed Access Responses	radiusAuthClientExt MalformedAccessRe sponses	The number of malformed RADIUS Access- Response packets received from the server. Malformed packets include packets with an invalid length. Bad authenticators or Message		

Rx/Tx	Name	RFC4668 Name [3]	Description		
			Authenticator attributes or unknown types are not		
			included as malformed access responses.		
Rx	Bad	radiusAuthClientExt	The number of RADIUS Access-Response packets		
	Authenticator	BadAuthenticators	containing invalid authenticators or Message		
	s		Authenticator attributes received from the server.		
Rx	Unknown	radiusAuthClientExt	The number of RADIUS packets that were received		
	Types	UnknownTypes	with unknown types from the server on the		
	<i>7</i>	71	authentication port and dropped.		
Rx	Packets	radiusAuthClientExt	The number of RADIUS packets that were received		
	Dropped	PacketsDropped	from the server on the authentication port and		
			dropped for some other reason.		
Тх	Access	radiusAuthClientExt	The number of RADIUS Access-Request packets		
	Requests	AccessRequests	sent to the server. This does not include		
			retransmissions.		
Tx	Access	radiusAuthClientExt	The number of RADIUS Access-Request packets		
	Retransmissi	AccessRetransmissio	retransmitted to the RADIUS authentication server.		
	ons	ns			
Tx			The number of RADIUS Access-Request packets		
			destined for the server that have not yet timed out		
	Pending	radiusAuthClientExt	or received a response. This variable is		
	Requests	PendingRequests	decremented due to receipt of an Access-Accept		
			Access-Reject. Access-Challenge, timeout, or		
			retransmission.		
Tx			The number of authentication timeouts to the server.		
			After a timeout, the client may retry to the same		
	Timeouts	radiusAuthClientExt	server, send to a different server, or give up. A retry		
		Timeouts	to the same server is counted as a retransmit as well		
			as a timeout. A send to a different server is counted		
			as a Request as well as a timeout.		

Other info: This section contains information about the state of the server and the latest round-trip time.

Name	RFC4668 Name [4]	Description
IP		IP address and UDP port for the authentication
Address	-	server in question.
		Shows the state of the server. It takes one of the
		following values:
		Disabled : The selected server is disabled.
		Not Ready: The server is enabled, but IP
		communication is not yet up and running.
		Ready: The server is enabled, IP communication is
		up and running, and the RADIUS module is ready
State		to accept access attempts.
Slate	-	Dead (X seconds left): Access attempts were made
		to this server, but it did not reply within the
		configured timeout. The server has temporarily
		been disabled, but will get re-enabled when the
		dead-time expires. The number of seconds left
		before this occurs is displayed in parentheses.
		This state is only reachable when more than one
		server is enabled.
		The time interval (measured in milliseconds)
		between the most recent Access-Reply/Access-
Round-		Challenge and the Access-Request that matched it
Trip	radius Auth Client ExtRound Trip Time	from the RADIUS authentication server. The
Time		granularity of this measurement is 100 ms. A value
		of 0 ms indicates that there hasn't been round-trip
		communication with the server yet.

Figure 135 - Radius Accounting Statistics for Server #1

The statistics map closely to those specified in RFC4670 - RADIUS Accounting Client MIB. [4]

Use the server select box to switch between the backend servers to show details for.

Packet Counters: RADIUS accounting server packet counter. There are five receive and four transmit counters.

Rx/Tx	Name	RFC4670 Name [4]	Description
Rx	Responses	radiusAccClientExtResponses	The number of RADIUS packets (valid or invalid) received from the server.
Rx	Malformed Responses	radiusAccClientExtMalformedResponses	The number of malformed RADIUS packets received from the server. Malformed packets include packets with an invalid length. Bad authenticators or unknown types are not included as

Rx/Tx	Name	RFC4670 Name [4]	Description
			malformed access
			responses.
Rx	Bad Authenticators	radiusAcctClientExtBadAuthenticators	The number of RADIUS packets containing invalid authenticators received from the server.
Rx	Unknown Types	radiusAccClientExtUnknownTypes	The number of RADIUS packets of unknown types that were received from the server on the accounting port.
Rx	Packets Dropped	radiusAccClientExtPacketsDropped	The number of RADIUS packets that were received from the server on the accounting port and dropped for some other reason.
Tx	Requests	radiusAccClientExtRequests	The number of RADIUS packets sent to the server. This does not include retransmissions.
Tx	Retransmissions	radiusAccClientExtRetransmissions	The number of RADIUS packets retransmitted to the RADIUS accounting server.
Tx	Pending Requests	radiusAccClientExtPendingRequests	The number of RADIUS packets destined for the server that have not yet timed out or received a response. This variable is incremented when a Request is sent and decremented due to receipt of a Response, timeout, or retransmission.
Tx	Timeouts	radiusAccClientExtTimeouts	The number of accounting timeouts to the server. After a timeout, the client may retry to the same server, send to a different server, or give up. A retry to the same server is counted as a retransmit as well as a timeout. A send to a different server is counted as a Request as well as a timeout.

Other info: This section contains information about the state of the server and the latest round-trip time.

5.9.5 NAS (802.1x)

5.9.5.1 Network Access Server Configuration

This page allows the user to configure the IEEE 802.1X and MAC-based authentication system and port settings. Network Access Server stands for NAS.

The IEEE 802.1X standard defines a port-based access control procedure that prevents unauthorized access to a network by requiring users to first submit credentials for authentication. One or more central servers (the backend servers) determine whether the user is allowed access to the network. They are configured at "Security \rightarrow AAA \rightarrow AAA" page.

MAC-based authentication allows for authentication of more than one user on the same port, and does not require the users to have special 802.1X software installed on their system. The switch uses the users' MAC addresses to authenticate against the backend server. As intruders can create counterfeit MAC addresses, which makes MAC-based authentication is less secure than 802.1 X authentications.

5.9.5.1.1Overview of 802.1X (Port-Based) Authentication

In an 802.1X network environment, the user is called the supplicant, the switch is the authenticator, and the RADIUS server is the authentication server. The switch acts as the man-in-the-middle, forwarding requests and responses between the supplicant and the authentication server. Frames sent between the supplicant and the switch are special 802.1X frames, known as EAPOL (EAP Over LANs) frames which encapsulate EAP PDUs [2] (RFC3748). Frames sent between the switch and the RADIUS server are RADIUS packets. RADIUS packets also encapsulate EAP PDUs together with other attributes like the switch's IP address, name, and the supplicant's port number on the switch. EAP is very flexible as it allows for different authentication methods, like MD5-Challenge, PEAP, and TLS. The important thing is that the authenticator (the switch) does not need to know which authentication method the supplicant and the authentication server are using, or how many information exchange frames are needed for a particular method. The switch simply encapsulates the EAP part of the frame into the relevant type (EAPOL or RADIUS) and forwards it.

When authentication is complete, the RADIUS server sends a special packet containing a success or failure indication. Besides forwarding the result to the supplicant, the switch uses it to open up or block traffic on the switch port connected to the supplicant.

Note: in an environment where two backend servers are enabled, the server timeout is configured to X seconds (using the authentication configuration page), and the first server in the list is currently down (but not considered dead), if the supplicant retransmits EAPOL Start frames at a rate faster than X seconds, it will never be authenticated because the switch will cancel on-going backend authentication server requests whenever it receives a new EAPOL Start frame from the supplicant. Since the server has not failed (because the X seconds have not expired), the same server will be contacted when the next back-end authentication server requests from the switch. This scenario will loop forever. Therefore, the server timeout should be smaller than the supplicant's EAPOL Start frame retransmission rate.

5.9.5.1.2Overview of MAC-Based Authentication

Unlike 802.1X, MAC-based authentication is not a standard, but merely a best-practices method adopted by the industry. In MAC-based authentication, users are called clients, and the switch acts as the supplicant on behalf of clients. The initial frame (any kind of frame) sent by a client is snooped by the switch, which in turn uses the client's MAC address as both username and password in the subsequent EAP exchange with the RADIUS server. The 6-byte MAC address is converted to a string in the following form "xx-xx-xx-xx-xx", that is, a dash (-) is used as separator between the lower-cased hexadecimal digits. The switch only supports the MD5-Challenge authentication method, so the RADIUS server must be configured accordingly.

When authentication is complete, the RADIUS server sends a success or failure indication, which in turn causes the switch to open up or block traffic for that particular client, using static entries into the MAC Table. Only then will frames from the client be forwarded on the switch. There are no EAPOL frames involved in this authentication, and therefore, MAC-based authentication has nothing to do with the 802.1X standard.

The advantage of MAC-based authentication over 802.1X is that several clients can be connected to the same port (e.g. through a 3rd party switch or a hub) and still require individual authentication, and that the clients do not need special supplicant software to authenticate. The disadvantage is that MAC addresses can be spoofed by malicious users, equipment whose MAC address is a valid RADIUS user can be used by anyone, and only the MD5-Challenge method is supported.

802.1x and MAC-Based authentication configurations consist of two sections: system- and port wide.

Refresh

Network Access Server Configuration

System Configuration

Mode	Enabled	~
Reauthentication Enabled	\checkmark	
Reauthentication Period	3600	seconds
EAPOL Timeout	30	seconds
Aging Period	300	seconds
Hold Time	10	seconds

Figure 136 - Network Access Server Configuration

Label	Description
Mode	Indicates if NAS is globally enabled or disabled on the switch. If globally disabled, all ports are allowed to forward frames.
Reauthentication Enabled	If checked, clients are re-authenticated after the interval specified by the Re- authentication Period. Re-authentication for 802.1X-enabled ports can be used to detect if a new device is plugged into a switch port. For MAC-based ports, re-authentication is only useful if the RADIUS server configuration has changed. It does not involve communication between the switch and the client, and therefore does not imply that a client is still present on a port (see Age Period below).
Reauthentication Period	Determines the period, in seconds, after which a connected client must be re- authenticated. This is only active if the Re-authentication is Enabled . Valid range of the value is 1 to 3600 seconds.
EAPOL Timeout	Determines the time for retransmission of Request Identity EAPOL frames. Valid range of the value is 1 to 65535 seconds. This has no effect for MAC- based ports.
Aging Period	This setting applies to the following modes, i.e. modes using the Port Security functionality to secure MAC addresses: MAC-Based Auth.: When the NAS module uses the Port Security module to secure MAC addresses, the Port Security module needs to check for activity on the MAC address in question at regular intervals and free resources if no activity is seen within a given period of time. This parameter controls exactly this period and can be set to a number between 10 and 1000000 seconds. For ports in MAC-based Auth. mode, reauthentication does not cause direct communications between the switch and the client, so this will not detect whether the client is still attached or not, and the only way to free any resources is to age the entry.
Hold Time	This setting applies to the following modes, i.e. modes using the Port Security functionality to secure MAC addresses: MAC-Based Auth.: If a client is denied access - either because the RADIUS server denies the client access or because the RADIUS server request times out (according to the timeout specified on the " Security → AAA → AAA " page), the client is put on hold in Unauthorized state. The hold timer does not count during an on-going authentication. The switch will ignore new frames coming from the client during the hold time. The hold time can be set to a number between 10 and 1000000 seconds.

5.9.5.1.3System Configuration

5.9.5.1.4Port Configuration

The table has one row for each port on the switch and a number of columns, which are:

Port Configuration

Port	Admin State	Port State	Restart		
*	◇ ∨

6	Force Authorized \sim	Link Down	Reauthenticate	Reinitialize	
7	802.1X 🗸	Unauthorized	Reauthenticate	Reinitialize	

Figure 137 - Network Access Server Port Configuration

Label	Description
Port	The port number for which the configuration below applies.
	If NAS is globally enabled, this selection controls the port's authentication mode.
	The following modes are available:
Admin State	 Force Authorized Force Unauthorized 802.1X MAC-based Auth. All modes are explained below.
Force Authorized	In this mode, the switch will send one EAPOL Success frame when the port link is up, and any client on the port will be allowed network access without authentication.
Force Unauthorized	In this mode, the switch will send one EAPOL Failure frame when the port link is up, and any client on the port will be disallowed network access.
802.1X	In the 802.1X-world, the user is called the supplicant, the switch is the authenticator, and the RADIUS server is the authentication server. The authenticator acts as the man-in-the-middle, forwarding requests and responses between the supplicant and the authentication server. Frames sent between the supplicant and the switch are special 802.1X frames, known as EAPOL (EAP Over LANs) frames. EAPOL frames encapsulate EAP PDUs [2]. Frames sent between the switch and the RADIUS server are RADIUS packets. RADIUS packets also encapsulate EAP PDUs together with other attributes like the switch's IP address, name, and the supplicant's port number on the switch. EAP is very flexible, in that it allows for different authenticator (the switch) doesn't need to know which authentication method the supplicant and the authentication server are using, or how many information exchange frames are needed for a particular method. The switch simply encapsulates the EAP part of the frame into the relevant type (EAPOL or RADIUS) and forwards it. When authentication. Besides forwarding this decision to the supplicant, the switch uses it to open up or block traffic on the switch port connected to the supplicant. <i>Note:</i> Suppose two backend servers are enabled and that the server timeout is configured to X seconds (using the AAA configuration page), and suppose that the first server in the list is currently down (but not considered dead). Now, if the

Label	Description			
	supplicant retransmits EAPOL Start frames at a rate faster than X seconds, then it will never get authenticated, because the switch will cancel on-going backend authentication server requests whenever it receives a new EAPOL Start frame from the supplicant. And since the server hasn't yet failed (because the X seconds haven't expired), the same server will be contacted upon the next backend authentication server request from the switch. This scenario will loop forever. Therefore, the server timeout should be smaller than the supplicant's EAPOL Start frame retransmission rate.			
MAC-based Auth.	Unlike 802.1X, MAC-based authentication is not a standard, but merely a best- practices method adopted by the industry. In MAC-based authentication, users are called clients, and the switch acts as the supplicant on behalf of clients. The initial frame (any kind of frame) sent by a client is snooped by the switch, which in turn uses the client's MAC address as both username and password in the subsequent EAP exchange with the RADIUS server. The 6-byte MAC address is converted to a string in the following form "xx-xx-xx-xx", that is, a dash (-) is used as separator between the lower-cased hexadecimal digits. The switch only supports the MD5-Challenge authentication method, so the RADIUS server must be configured accordingly. When authentication is complete, the RADIUS server sends a success or failure indication, which in turn causes the switch to open up or block traffic for that particular client, using the Port Security module. Only then will frames from the client be forwarded on the switch. There are no EAPOL frames involved in this authentication, and therefore, MAC-based Authentication has nothing to do with the 802.1X standard. The advantage of MAC-based authentication over port-based 802.1X is that several clients can be connected to the same port (e.g. through a 3rd party switch or a hub) and still require individual authentication, and that the clients don't need special supplicant software to authenticate. The disadvantage is that MAC addresses can be spoofed by malicious users - equipment whose MAC address is a valid RADIUS user can be used by anyone. Also, only the MD5-Challenge method is supported. The maximum number of clients that can be attached to a port can be limited using the Port Security Limit Control functionality.			
Port State	The current state of the port. It can undertake one of the following values: Globally Disabled : NAS is globally disabled. Link Down : NAS is globally enabled, but there is no link on the port. Authorized : the port is in Force Authorized or a single-supplicant mode and the supplicant is authorized. Unauthorized : the port is in Force Unauthorized or a single-supplicant mode and the supplicant is not successfully authorized by the RADIUS server. X Auth/Y Unauth : the port is in a multi-supplicant mode. Currently X clients are authorized and Y are unauthorized.			
Restart	Two buttons are available for each row. The buttons are only enabled when authentication is globally enabled and the port's Admin State is in an EAPOL-based or MAC-based mode. Clicking these buttons will not cause settings changed on the page to take effect. Reauthenticate: schedules a reauthentication whenever the quiet-period of the port runs out (EAPOL-based authentication). For MAC-based authentication, reauthentication will be attempted immediately. The button only has effect on successfully authenticated clients on the port and will not cause the clients to be temporarily unauthorized. Reinitialize: forces a reinitialization of the clients on the port and hence a reauthentication immediately. The clients will transfer to the unauthorized state while the reauthentication is in progress.

Add New Static Entry

Save Reset

Figure 149 - MAC Address Table Configuration

5.11.1.1.1 Aging Configuration

By default, dynamic entries are removed from the MAC after 300 seconds. This removal is called

aging.

You can configure aging time by entering a value in the box of **Age Time**. The allowed range is 10 to 1000000 seconds. You can also disable the automatic aging of dynamic entries by checking

Disable Automatic Aging.

5.11.1.1.2 MAC Table Learning

If the learning mode for a given port is grayed out, it means another module is in control of the mode, and thus the user cannot change the configurations. An example of such a module is MAC-Based authentication under 802.1X.

The port can be configures to learn dynamically the MAC address based upon the following settings:

Label	Description
Auto	Learning is done automatically as soon as a frame with unknown SMAC is received.
Disable	No learning is done.
Secure	Only static MAC entries are learned, all other frames are dropped. Note: make sure the link used for managing the switch is added to the static Mac table before changing to secure learning mode, otherwise the management link will be lost and can only be restored by using another non-secure port or by connecting to the switch via the serial interface.

5.11.1.1.3 Static MAC Table Configurations

The static entries in the MAC table are shown in this table. The static MAC table can contain up to 64 entries. The entries are for the whole stack, not for individual switches. The MAC table is sorted first by VLAN ID and then by MAC address.

Label	Description							
Delete	Check to delete an entry. It will be deleted during the next save.							
VLAN ID	The VLAN ID for the entry.							
MACAddress	The MAC address for the entry.							
Port Members	Checkmarks indicate which ports are members of the entry.							
	Check or uncheck to modify the entry.							
Add New Static Entry	Click to add a new entry to the static MAC table. specify the VLAN ID,							
	MAC address, and port members for the new entry.							
	Click Save to save the changes.							

5.11.1.2 MAC Address Table

Entries in the MAC Table are shown on this page. The MAC Address Table contains up to 8192 entries, and is sorted first by VLAN ID, then by MAC address.

Each page shows up to 999 entries from the MAC table, with a default value of 20, selected by the **Entries Per Page** input field. When first visited, the web page will show the first 20 entries from the beginning of the MAC Table. The first displayed will be the one with the lowest VLAN ID and the lowest MAC address found in the MAC Table.

The Start from MAC address and VLAN fields allow the user to select the starting point in the MAC

table. Clicking the **Refresh** button will update the displayed table starting from that or the closest next MAC table match. In addition, the two input fields will – upon clicking **Refresh** - assume the value of the first displayed entry, allows for continuous refresh with the same start address. The >> will use the last entry of the currently displayed VLAN/MAC address pairs as a basis for the next lookup. When it reaches the end, the text "**no more entries**" is shown in the displayed table. Use the |<< button to start over.

Rx Undersize 0			
Rx Oversize 0			
Rx Fragments 0			
Rx Jabber 0			
Rx Filtered 6651			

Figure 152 - Detailed Post Statistics

Label	Description					
Rx and Tx Packets	The number of received and transmitted (good and bad) packets.					
Rx and Tx Octets	The number of received and transmitted (good and bad) bytes including FCS,					
Rx and Tx Unicast	'he number of received and transmitted (good and bad) unicast packets.					
Rx and Tx Multicast	The number of received and transmitted (good and bad) multicast packets.					
Rx and Tx Broadcast	The number of received and transmitted (good and bad) broadcast packets.					
Rx and Tx Pause	The number of MAC Control frames received or transmitted on this port that have an opcode indicating a PAUSE operation.					
Rx and Tx Size Counters	The number of received and transmitted (good and bad) packets split into categories based on their respective frame sizes.					
Rx and Tx Queue Counters	The number of received and transmitted packets per input and output queue.					
Rx Drops	The number of frames dropped due to insufficient receive buffer or egress congestion.					
Rx CRC/Alignment	The number of frames received with CRC or alignment errors.					
Rx Undersize	The number of short 1 frames received with a valid CRC.					
Rx Oversize	The number of long 2 frames received with a valid CRC.					
Rx Fragments	The number of short 1 frames received with an invalid CRC.					
Rx Jabber	The number of long ² frames received with an invalid CRC.					
Rx Filtered	The number of received frames filtered by the forwarding process.					
Tx Drops	The number of frames dropped due to output buffer congestion.					
Tx Late / Exc. Coll.	The number of frames dropped due to excessive or late collisions.					

1. Short frames are frames smaller than 64 bytes.

2. Long frames are frames longer than the maximum frame length configured for this port.

5.11.3 **Port Monitoring**

You can configure port mirroring on this page. To solve network problems, selected traffic can be copied, or mirrored, to a mirror port where a frame analyzer can be attached to analyze the frame flow.

The traffic to be copied to the mirror port is selected as follows:

- All frames received on a given port (also known as ingress or source mirroring).
- All frames transmitted on a given port (also known as egress or destination mirroring).

Port to mirror is also known as the mirror port. Frames from ports that have either source (rx) or destination (tx) mirroring enabled are mirrored to this port.

Disabled option disables mirroring.

Figure 153 - Mirror Configuration

Label	Description
Port	The logical port for the settings contained in the same row.
	Select mirror mode.
	Disabled—neither frames transmitted nor frames received are mirrored
Mode	Rx only —Frames received on this port are mirrored on the mirror port. Frames transmitted are not mirrored.
	Tx only —Frames transmitted on this port are mirrored on the mirror port. Frames received are not mirrored.
	Enabled —Frames received and frames transmitted are mirrored on the mirror port.
Save	Click to save changes
Reset	Click to undo any changes made locally and revert to previously saved values.

Note: For a given port, a frame is only transmitted once. It is therefore not possible to mirror **port** Tx frames. Because of this, the **Mode** for the selected **mirror port** (which in the Figure above is Port 1) is limited to **Disabled** or **Rx only**.

5.11.4 System Log Information

This page provides switch system log information.

System Log Information

Auto-refresh	Refresh	Clear	<<	<<	>>	>>
--------------	---------	-------	----	----	----	----

The total number of entries is 3 for the given level.

Start from ID 1 with 20 entries per page.

ID	Time	Message
1	1970-01-01 00:00:03+00:00	Switch just made a cool boot.
2	1970-01-01 00:00:07+00:00	Power1 OFF
3	1970-01-01 00:00:07+00:00	Power2 ON

Figure 154 - System Log Information

Label	Description
ID	The ID (>= 1) of the system log entry
Message	The message of the system log entry.
Auto-refresh	Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.
Refresh	Updates system log entries, starting from the current entry ID.
Clear	Flushes all system log entries.
<<	Updates system log entries, starting from the first available entry ID.
<<	Updates system log entries, ending at the last entry currently displayed.
>>	Updates system log entries, starting from the last entry currently displayed.
>>	Updates system log entries, ending at the last available entry ID.

5.11.5 VeriPHY Cable Diagnostics

This page is used for running the VeriPHY Cable Diagnostics for 10/100 and 1G copper ports.

Click **Start** to run the diagnostics. This will take approximately 5 seconds. If all ports are selected, this can take approximately 15 seconds. When completed, the page refreshes automatically, and you can view the cable diagnostics results in the cable status table. Note that VeriPHY is only accurate for cables of length 7 - 140 meters.

10 and 100 Mbps ports will be linked down while running VeriPHY. Therefore, running VeriPHY on a 10 or 100 Mbps management port will cause the switch to stop responding until VeriPHY is complete.

This page allows the user to perform VeriPHY cable diagnostics.

VeriPHY Cable Diagnostics

Port All \sim

5.11.8 **Ping**

Ping operates by sending <u>Internet Control Message Protocol</u> (ICMP) echo request packets to the target host and waiting for an ICMP echo reply.

This page allows the user to issue ICMP packets to troubleshoot IP connectivity issues.

ICMP Ping Output

ICMP Ping

Start

IP Address	0.0.0.0	
Ping Length	56	
Ping Count	5	
Ping Interval	1	

PING server 0.0.0.0, 56 bytes of data. recvfrom: Operation timed out Sent 5 packets, received 0 OK, 0 bad, 5 lost

New Ping

Figure 157 - ICMP Ping

After you press Start, five ICMP packets will be transmitted, and the sequence number and

roundtrip time will be displayed upon reception of a reply (see the second part of the figure above).

Click New Ping to return to ICMP Ping screen.

The following properties of the issued ICMP packets can be configured:

Label	Description		
IP Address	The destination IP Address		
Ping Length	The payload size of the ICMP packet. Values range from 8 to 1400 bytes.		
Ping Count The count of the ICMP packet. Values range from 1 time to 60 times.			
Ping Interval The interval of the ICMP packet. Values range from 0 second to 30 seconds.			

5.11.9 Ping6

This page allows the user to issue ICMPv6 Ping packets to troubleshoot IP connectivity issues.

ICMPv6 Ping

IP Address	0:0:0:0:0:0:0:0
Ping Length	56
Ping Count	5
Ping Interval	1

ICMPv6 Ping Output

PING6 server ::, 56 bytes of data. recvfrom: Operation timed out Sent 5 packets, received 0 OK, 0 bad, 5 lost

Start

Figure 158 – ICMPv6 Ping

New Ping

Label	Description		
IP Address	The destination IPAddress		
Ping Length	The payload size of the ICMPv6 packet. Values range from 8 to 65,535 bytes. [7]		
Ping Count	The count of the ICMP packet. Values range from 1 time to 60 times.		
Ping Interval	The interval of the ICMP packet. Values range from 0 second to 30 seconds.		

5.12 Factory Defaults

You can reset the configuration of the stack switch on this page. The IP configuration and/or User/Password are retained only if the respective boxes are checked when the switch is restored to factory defaults.

Factory Defaults

Figure 159 - Factory Defaults

Label	Description	
Yes	Click to reset the configuration to factory defaults.	
No	Click to return to the System Information page without resetting.	

5.13 System Reboot

You can reset the stack switch on this page. After reset, the system will boot normally as if you have powered on the devices.

Restart Device

Are you sure you want to perform a Restart?

Yes No

Figure 160 - System Reboot - Restart Device

Label	Description	
Yes	Click to reboot device.	
No	Click to return to the System Information page without rebooting.	

6. CLI MANAGEMENT

6.1 Command Line Interface Setup

6.1.1 CLI Management by RS-232 Serial Console (115200, 8, none, 1, none)

Before configuring RS-232 serial console, connect the RS-232 port of the switch to your PC. Follow the steps below to access the console via a RS-232 serial cable.

1. Start Tara Term VT (or other terminal emulator) application.

or the app from Command Prompt

2. Go to **Setup** menu and select **Serial Port**.

📒 СОМЗ:9	600baud - Tera Term VT

Figure 163 - iES22GF Command Line Interface - Tera Term VT

6.1.2 CLI Management by Telnet

You can use **TELNET** to configure the switch. The default values are:

IPAddress: 192.168.10.1

Subnet Mask: 255.255.255.0

Default Gateway: 192.168.10.254

User Name: admin

Password: admin

Follow the steps below to access the console via Telnet.

- 1. Connect your PC to one of the Ethernet ports of the switch via an Ethernet cable.
- 2. Telnet to the IP address of the switch from the Windows "**Run**" command (or from the MS-DOS prompt).

📼 Run	
	Type the name of a program, folder, document, or Internet resource, and Windows will open it for you.
Open:	telnet 192.168.10.1
	OK Cancel Browse

Figure 164 - Telnet Command Prompt

3. The Console login screen appears. Use the keyboard to enter the Console Username and Password, then press "Enter". This is the same as the Web Browser password. The default Username is "admin" and the default Password is "admin".

6.1.3.1 System

>system ? Available Commands:

System Configuration [all | (port <port_list>)] System Log Configuration System Timezone Configuration System Version System Log Server Mode [enable|disable] System Name [<name>] System Timezone Offset [<offset>] System Contact [<contact>] System Log Server Address [<ip_addr_string>] System Timezone Acronym [<acronym>] System Description [<description>] System DST Configuration System Log Level [info|warning|error] System DST Mode [disable | recurring | non-recurring] System Location [<location>] System DST start <week> <day> <month> <date> <year> <hour> <minute> System Log Lookup [<log_id>] [all|info|warning|error] System DST end <week> <day> <month> <date> <year> <hour> <minute> System Log Clear [all|info|warning|error] System DST Offset [<dst_offset>] System Reboot System Restore Default [keep_ip] System Load System INTP [enable|disable] System Banner Title [<title>] System Banner Message [<message>]

6.1.3.2 IP

>IP ? Available Commands:

```
IP Configuration
IP DHCP [enable|disable]
IP Setup [<ip_addr>] [<ip_mask>] [<ip_router>] [<vid>]
IP Ping <ip_addr_string> [(Length <ping_length>)] [(Count <ping_count>)] [(Interval
<ping_interval>)]
IP SNTP Mode [enable|disable]
IP SNTP Server1 Add [<ip_addr_string>]
IP SNTP Server2 Add [<ip_addr_string>]
IP SNTP Server1 Delete
IP SNTP Server2 Delete
IP IPv6 AUTOCONFIG [enable|disable]
IP IPv6 Setup [<ipv6_addr>] [<ipv6_prefix>] [<ipv6_router>]
IP IPv6 State <ipv6_addr> [enable|disable]
IP IPv6 Ping6 <ipv6_addr> [(Length <ping_length>)] [(Count <ping_count>)] [(Interval
<ping interval>)]
IP IPv6 SNTP Server1 Add [<ipv6 addr>]
IP IPv6 SNTP Server2 Add [<ipv6 addr>]
IP IPv6 SNTP Server1 Delete
IP IPv6 SNTP Server2 Delete
```

6.1.3.3 Port

>port ? Available Commands: Port Configuration [<port_list>] [up|down] Port Mode [<port_list>] [auto|10hdx|10fdx|100hdx|100fdx|1000fdx|sfp_auto_ams] Port Flow Control [<port_list>] [enable|disable] Port State [<port_list>] [enable|disable] Port MaxFrame [<port_list>] [<max_frame>] Port Power [<port_list>] [enable|disable|actiphy|dynamic] Port Excessive [<port_list>] [discard|restart] Port Statistics [<port_list>] [<command>] [up|down] Port VeriPHY [<port_list>] Port SFP [<port_list>]

6.1.3.4 MAC

```
>mac ?
Available Commands:
```

```
MAC Configuration [<port_list>]
MAC Add <mac_addr> <port_list> [<vid>]
MAC Delete <mac_addr> [<vid>]
MAC Lookup <mac_addr> [<vid>]
MAC Lookup <mac_addr> [<vid>]
MAC Agetime [<age_time>]
MAC Learning [<port_list>] [auto|disable|secure]
MAC Dump [<mac_max>] [<mac_addr>] [<vid>]
MAC Statistics [<port_list>]
MAC Flush
>
```

6.1.3.5 VLAN

>vlan ? Available Commands:

```
VLAN Configuration [<port_list>]
VLAN PVID [<port_list>] [<vid>|none]
VLAN FrameType [<port_list>] [all|tagged|untagged]
VLAN IngressFilter [<port_list>] [enable|disable]
VLAN tx_tag [<port_list>] [untag_pvid|untag_all|tag_all]
VLAN PortType [<port_list>] [unaware|c-port|s-port|s-custom-port]
VLAN EtypeCustomSport [<etype>]
VLAN Add <vid>| <name> [<ports_list>]
VLAN Forbidden Add <vid>|<name> [<port_list>]
VLAN Delete <vid>|<name>
VLAN Forbidden Delete <vid>|<name>
VLAN Forbidden Lookup [<vid>] [(name <name>)]
VLAN Lookup [<vid>] [(name <name>)] [combined|static|nas|all]
VLAN Name Add <name> <vid>
VLAN Name Delete <name>
VLAN Name Lookup [<name>]
VLAN Status [<port_list>] [combined|static|nas|mstp|all|conflicts]
>
```

6.1.3.6 Private VLAN (PVLAN)

>pvlan ? Available Commands:

PVLAN Configuration [<port_list>] PVLAN Add <pvlan_id> [<port_list>] PVLAN Delete <pvlan_id> PVLAN Lookup [<pvlan_id>] PVLAN Isolate [<port_list>] [enable|disable]

6.1.3.7 security

>security ?

Command Groups:

Switch : Switch security Network : Network security AAA : Authentication, Authorization and Accounting

Type '<group>' to enter command group Type '<group> ?' to get group help

>security Type 'up' to move up one level or '/' to go to root level

6.1.3.7.1Security Switch

Security>switch?

Command Groups:

Security Switch Password : System password Security Switch Privilege: Privilege level Security Switch Auth : Authentication Security Switch SSH : Secure Shell Security Switch TELNET : Telnet management Security Switch HTTPS : Hypertext Transfer Protocol over Secure Socket Layer Security Switch RMON : Remote Network Monitoring

Type '<group>' to enter command group Type '<group> ?' to get list of group commands Type '<group> <command> ?' to get help on a command

6.1.3.7.1.1 Security Switch Password

Security/Switch> Security/Switch>password? Description:

Set the system password.

Syntax: ------Security Switch Password <username> <password>

Parameters:

<username>: Username string.
 <password>: System password string. Use 'clear' or "" to clear the string Security/Switch>

6.1.3.7.1.2 Security Switch Privilege

Security/Switch>Privilege ? Available Commands:

Security Switch Privilege Level Configuration Security Switch Privilege Level Group <group_name> [<cro>] [<crw>] [<sro>] [<srw>] Security Switch Privilege Level Current

6.1.3.7.1.3 Security Switch Authentication

Security/Switch>auth? Available Commands:

Security Switch Auth Configuration Security Switch Auth Method [console|telnet|ssh|web] [none|local|radius|tacacs+] [enable|disable]] Security/Switch/Auth> configuration

Auth Configuration:

Client Authentication Method Local Authentication Fallback

consc	ole local	Disabled
telnet	local	Disabled
ssh	local	Disabled
web	local	Disabled

6.1.3.7.1.4 Security Switch SSH

Security/Switch/Auth>up Security/Switch>ssh? Available Commands:

Security Switch SSH Configuration Security Switch SSH Mode [enable|disable]:

6.1.3.7.1.5 Security Switch TELNET

Security/Switch>TELNET ? Available Commands:

Security Switch TELNET Configuration Security Switch TELNET Mode [enable|disable] Security/Switch>

6.1.3.7.1.6 Security Switch HTTPS

Security/Switch>HTTPS? Available Commands:

Security Switch HTTPS Configuration Security Switch HTTPS Mode [enable|disable] Security/Switch>

6.1.3.7.1.7 Security Switch RMON

Security/Switch>rmon ? Available Commands:

Security Switch RMON Statistics Add <stats_id> <data_source> Security Switch RMON Statistics Delete <stats_id> Security Switch RMON Statistics Lookup [<stats_id>] Security Switch RMON History Add <history_id> <data_source> [<interval>] [<buckets>] Security Switch RMON History Delete <history_id> Security Switch RMON History Lookup [<history_id>] Security Switch RMON History Lookup [<history_id>] Security Switch RMON Alarm Add <alarm_id> <interval> <alarm_variable> [absolute|delta] <rising_threshold> <rising_event_index> <falling_threshold> <falling_event_index> [rising|falling|both] Security Switch RMON Alarm Delete <alarm_id> Security Switch RMON Alarm Lookup [<alarm_id>] Security Switch RMON Event Add <event_id> [none|log|trap|log_trap] [<community>] [<description>] Security Switch RMON Event Delete <event_id> Security Switch RMON Event Lookup [<event_id>] Security/Switch>

6.1.3.7.2Security Network

Security>network?

Command Groups:

Security Network Psec : Port Security Status Security Network NAS : Network Access Server (IEEE 802.1X) Security Network ACL : Access Control List Security Network DHCP : Dynamic Host Configuration Protocol

6.1.3.7.1.1 Security Network Psec

Security/Network>psec ? Available Commands:

Security Network Psec Switch [<port_list>] Security Network Psec Port [<port_list>] Security/Network>

6.1.3.7.1.2 Security Network NAS

Security/Network>nas? Available Commands:

Security Network NAS Configuration [<port_list>] Security Network NAS Mode [enable|disable] Security Network NAS State [<port_list>] [auto|authorized|unauthorized|macbased] Security Network NAS Reauthentication [enable|disable] Security Network NAS ReauthPeriod [<reauth_period>] Security Network NAS EapolTimeout [<eapol_timeout>] Security Network NAS Agetime [<age_time>] Security Network NAS Holdtime [<hold_time>] Security Network NAS Authenticate [<port_list>] [now] Security Network NAS Statistics [<port_list>] [clear|eapol|radius] Security/Network>
6.1.3.7.1.3 Security Network ACL

Security/Network>acl? Available Commands:

Security Network ACL Configuration [<port_list>] Security Network ACL Action [<port_list>] [permit|deny] [<rate_limiter>] [<port_redirect>] [<mirror>] [<logging>] [<shutdown>] Security Network ACL Policy [<port_list>] [<policy>] Security Network ACL Rate [<rate_limiter_list>] [<rate_unit>] [<rate>] Security Network ACL Add [<ace_id>] [<ace_id_next>] [(port <port_list>)] [(policy <policy> <policy_bitmask>)] [<tagged>] [<vid>] [<tag_prio>] [<dmac_type>] [(etype [<etype>] [<smac>] [<dmac>]) | (arp [<sip>] [<dip>] [<smac>] [<arp_opcode>] [<arp_flags>]) | (ip [<sip>] [<dip>] [<protocol>] [<ip_flags>]) | (icmp [<sip>] [<dip>] [<icmp_type>] [<icmp_code>] [<ip_flags>]) | (udp [<sip>] [<dip>] [<sport>] [<dport>] [<ip_flags>]) | (tcp [<sip>] [<dip>] [<sport>] [<dport>] [<ip_flags>] [<tcp_flags>])] [permit|deny][<rate_limiter>][<port_redirect>][<mirror>][<logging>][<shutdown>] Security Network ACL Delete <ace_id> Security Network ACL Lookup [<ace_id>] Security Network ACL Clear Security Network ACL Status [combined|static|loop_protect|dhcp| ipmc|conflicts] Security Network ACL Port State [<port_list>] [enable|disable] Security/Network>

6.1.3.7.1.4 Security Network DHCP

Security/Network>DHCP ? Available Commands:

Security Network DHCP Relay Configuration Security Network DHCP Relay Mode [enable|disable] Security Network DHCP Relay Server [<ip_addr>] Security Network DHCP Relay Information Mode [enable|disable] Security Network DHCP Relay Information Policy [replace|keep|drop] Security Network DHCP Relay Statistics [clear] Security/Network>

6.1.3.7.3Security AAA

Security> AAA ? Available Commands:

Security AAA Configuration Security AAA Timeout [<timeout>] Security AAA Deadtime [<dead_time>] Security AAA RADIUS [<server_index>] [enable|disable] [<ip_addr_string>] [<secret>] [<server_port>] Security AAA ACCT_RADIUS [<server_index>] [enable|disable] [<ip_addr_string>] [<secret>] [<server_port>] Security AAA TACACS+ [<server_index>] [enable|disable] [<ip_addr_string>] [<secret>] [<server_port>] Security AAA Statistics [<server_index>] Security AAA Statistics [<server_index>]

6.1.3.8 STP

>stp ? Available Commands: **STP Configuration** STP Version [<stp_version>] STP Txhold [<holdcount>] STP MaxHops [<maxhops>] STP MaxAge [<max_age>] STP FwdDelay [<delay>] STP CName [<config-name>] [<integer>] STP bpduFilter [enable|disable] STP bpduGuard [enable|disable] STP recovery [<timeout>] STP Status [<msti>] [<stp_port_list>] STP Msti Priority [<msti>] [<priority>] STP Msti Map [<msti>] [clear] STP Msti Add <msti> <vid-range> STP Port Configuration [<stp_port_list>] STP Port Mode [<stp_port_list>] [enable|disable] STP Port Edge [<stp_port_list>] [enable|disable] STP Port AutoEdge [<stp_port_list>] [enable|disable] STP Port P2P [<stp_port_list>] [enable|disable|auto] STP Port RestrictedRole [<stp_port_list>] [enable|disable] STP Port RestrictedTcn [<stp_port_list>] [enable|disable] STP Port bpduGuard [<stp_port_list>] [enable|disable] STP Port Statistics [<stp_port_list>] [clear] STP Port Mcheck [<stp_port_list>] STP Msti Port Configuration [<msti>] [<stp_port_list>] STP Msti Port Cost [<msti>] [<stp_port_list>] [<path_cost>] STP Msti Port Priority [<msti>] [<stp_port_list>] [<priority>] >

6.1.3.9 SNMP

>snmp ? Available Commands:

SNMP Configuration SNMP Mode [enable|disable] SNMP Version [1|2c|3] SNMP Read Community [<community>] SNMP Write Community [<community>] SNMP Trap Mode [enable|disable] SNMP Trap Version [1|2c|3] SNMP Trap Community [<community>] SNMP Trap Destination [<ip_addr_string>] SNMP Trap IPv6 Destination [<ipv6_addr>] SNMP Trap Authentication Failure [enable|disable] SNMP Trap Link-up [enable|disable] SNMP Trap Inform Mode [enable|disable] SNMP Trap Inform Timeout [<timeout>] SNMP Trap Inform Retry Times [<retries>] SNMP Trap Probe Security Engine ID [enable|disable] SNMP Trap Security Engine ID [<engineid>] SNMP Trap Security Name [<security_name>] SNMP Engine ID [<engineid>] SNMP Community Add <community> [<ip_addr>] [<ip_mask>] SNMP Community Delete <index> SNMP Community Lookup [<index>] SNMP User Add <engineid> <user_name> [MD5|SHA] [<auth_password>] [DES] [<priv_password>] SNMP User Delete <index> SNMP User Changekey <engineid> <user_name> <auth_password> [<priv_password>]

SNMP User Lookup [<index>]
SNMP Group Add <security_model> <security_name> <group_name>
SNMP Group Delete <index>
SNMP Group Lookup [<index>]
SNMP View Add <view_name> [included|excluded] <oid_subtree>
SNMP View Delete <index>
SNMP View Lookup [<index>]
SNMP Access Add <group_name> <security_model> <security_level>
 [<read_view_name>] [<write_view_name>]
SNMP Access Delete <index>
SNMP Access Lookup [<index>]

6.1.3.10 Aggr

>aggr ? Available Commands:

Aggr Configuration Aggr Add <port_list> [<aggr_id>] Aggr Delete <aggr_id> Aggr Lookup [<aggr_id>] Aggr Mode [smac|dmac|ip|port] [enable|disable] >

6.1.3.11 LACP

>lacp ? Available Commands:

LACP Configuration [<port_list>] LACP Mode [<port_list>] [enable|disable] LACP Key [<port_list>] [<key>] LACP Prio [<port_list>] [<prio>] LACP System Prio [<sysprio>] LACP Role [<port_list>] [active|passive] LACP Status [<port_list>] LACP Statistics [<port_list>] LACP Statistics [<port_list>] [clear] LACP Timeout [<port_list>] [fast|slow]

6.1.3.12 LLDP

>lldp ? Available Commands:

LLDP Configuration [<port_list>] LLDP Mode [<port_list>] [enable|disable] LLDP Statistics [<port_list>] [clear] LLDP Info [<port_list>]

6.1.3.13 QoS

>qos ? Available Commands:

QoS Configuration [<port_list>] QoS Port Classification Class [<port_list>] [<class>] QoS Port Classification DPL [<port_list>] [<dpl>] QoS Port Classification PCP [<port_list>] [<pcp>] QoS Port Classification DEI [<port_list>] [<dei>] QoS Port Classification Tag [<port_list>] [enable|disable] QoS Port Classification Map [<port_list>] [<pcp_list>] [<dei_list>] [<dpl>] QoS Port Classification DSCP [<port list>] [enable|disable] QoS Port Policer Mode [<port_list>] [enable|disable] QoS Port Policer Rate [<port_list>] [<rate>] QoS Port Policer Unit [<port_list>] [kbps|fps] QoS Port Policer FlowControl [<port_list>] [enable|disable] QoS Port QueuePolicer Mode [<port_list>] [<queue_list>] [enable|disable] QoS Port QueuePolicer Rate [<port_list>] [<queue_list>] [<bit_rate>] QoS Port Scheduler Mode [<port_list>] [strict|weighted] QoS Port Scheduler Weight [<port_list>] [<queue_list>] [<weight>] QoS Port Shaper Mode [<port_list>] [enable|disable] QoS Port Shaper Rate [<port_list>] [<bit_rate>] QoS Port QueueShaper Mode [<port_list>] [<queue_list>] [enable|disable] QoS Port QueueShaper Rate [<port_list>] [<queue_list>] [<bit_rate>] QoS Port QueueShaper Excess [<port_list>] [<queue_list>] [enable|disable] QoS Port TagRemarking Mode [<port_list>] [classified|default|mapped] QoS Port TagRemarking PCP [<port_list>] [<pcp>] QoS Port TagRemarking DEI [<port_list>] [<dei>] QoS Port TagRemarking Map [<port_list>] [<class_list>] [<dpl_list>] [<pcp>] [<dei>] QoS Port DSCP Translation [<port_list>] [enable|disable] QoS Port DSCP Classification [<port_list>] [none|zero|selected|all] QoS Port DSCP EgressRemark [<port_list>] [disable|enable|remap_dp_unaware|remap_dp_aware] QoS DSCP Map [<dscp_list>] [<class>] [<dpl>] QoS DSCP Translation [<dscp_list>] [<trans_dscp>] QoS DSCP Trust [<dscp_list>] [enable|disable] QoS DSCP Classification Mode [<dscp_list>] [enable|disable] QoS DSCP Classification Map [<class_list>] [<dpl_list>] [<dscp>] QoS DSCP EgressRemap [<dscp_list>] [<dpl_list>] [<dscp>] QoS Storm Unicast [enable|disable] [<packet rate>] QoS Storm Multicast [enable|disable] [<packet_rate>] QoS Storm Broadcast [enable|disable] [<packet_rate>] QoS QCL Add [<qce_id>] [<qce_id_next>] [<port_list>] [<tag>] [<vid>] [<pcp>] [<dei>] [<smac>] [<dmac_type>] [(etype [<etype>]) | (LLC [<DSAP>] [<SSAP>] [<control>]) | (SNAP [<PID>]) | (ipv4 [<protocol>] [<sip>] [<dscp>] [<fragment>] [<sport>] [<dport>]) | (ipv6 [<protocol>] [<sip_v6>] [<dscp>] [<sport>] [<dport>])] [<class>] [<dp>] [<classified_dscp>] QoS QCL Delete <qce_id> QoS QCL Lookup [<qce_id>] QoS QCL Status [combined|static|conflicts] **QoS QCL Refresh**

6.1.3.14 Mirror

>mirror ? Available Commands:

```
Mirror Configuration [<port_list>]
Mirror Port [<port>|disable]
Mirror Mode [<port_cpu_list>] [enable|disable|rx|tx]
>
```

6.1.3.15 Config

>config ? Available Commands:

Config Save <ip_server> <file_name>

Config Load <ip_server> <file_name> [check]

6.1.3.16 Firmware

>firmware ? Available Commands:

Firmware Load <ip_addr_string> <file_name> Firmware IPv6 Load <ipv6_server> <file_name> Firmware Information

6.1.3.17 Firmware SwapLoop Protect

>loop protect ? Available Commands:

Loop Protect Configuration Loop Protect Mode [enable|disable] Loop Protect Transmit [<transmit-time>] Loop Protect Shutdown [<shutdown-time>] Loop Protect Port Configuration [<port_list>] Loop Protect Port Mode [<port_list>] [enable|disable] Loop Protect Port Action [<port_list>] [shutdown|shut_log|log] Loop Protect Port Transmit [<port_list>] [enable|disable] Loop Protect Status [<port_list>]

6.1.3.18 **IPMC**

>ipmc ? Available Commands:

IPMC Configuration [igmp] IPMC Mode [igmp] [enable|disable] IPMC Flooding [igmp] [enable|disable] IPMC VLAN Add [igmp] <vid> IPMC VLAN Delete [igmp] <vid> IPMC State [igmp] [<vid>] [enable|disable] IPMC Querier [igmp] [<vid>] [enable|disable] IPMC Fastleave [igmp] [<port_list>] [enable|disable] IPMC Router [igmp] [<port_list>] [enable|disable] IPMC Status [igmp] [<vid>] IPMC Groups [igmp] [<vid>] IPMC Version [igmp] [<vid>]

6.1.3.19 Fault

>fault ? Available Commands: Fault Alarm PortLinkDown [<port_list>] [enable|disable] Fault Alarm PowerFailure [pwr1|pwr2|pwr3] [enable|disable]

6.1.3.20 Event

>event ? Available Commands:

Event Configuration Event Syslog SystemStart [enable|disable] Event Syslog PowerStatus [enable|disable] Event Syslog SnmpAuthenticationFailure [enable|disable] Event Syslog RingTopologyChange [enable|disable] Event Syslog Port [<port_list>] [disable|linkup|linkdown|both] Event SMTP SystemStart [enable|disable] Event SMTP PowerStatus [enable|disable] Event SMTP SnmpAuthenticationFailure [enable|disable] Event SMTP RingTopologyChange [enable|disable] Event SMTP Port [<port_list>] [disable|linkup|linkdown|both]

6.1.3.21 DHCPServer

DHCPServer> ? Available Commands:

DHCPServer Mode [enable|disable] DHCPServer Setup [<ip_start>] [<ip_end>] [<ip_mask>] [<ip_router>] [<ip_dns>] [<ip_tftp>] [<lease>] [<bootfile>] DHCPServer Client List DHCPServer Client AddStatic <mac_addr> <ip_addr> DHCPServer Client Delete <no.> DHCPServer Client SetStatic <no.>

6.1.3.22 iRing

>iring ? Available Commands:

iRing Mode [enable|disable] iRing Master [enable|disable] iRing 1stRingPort [<port>] iRing 2ndRingPort [<port>] iRing Ring-Linking Mode [enable|disable] iRing Ring-Linking Port [<port>] iRing Dual-Homing Mode [enable|disable] iRing Dual-Homing Port [<port>]

6.1.3.23 iChain

>ichain ? Available Commands:

iChain Configuration iChain Mode [enable|disable] iChain 1stUplinkPort [<port>] iChain 2ndUplinkPort [<port>] iChain EdgePort [1st|2nd|none]

6.1.3.24 iBridge

>ibridge ? Available Commands:

iBridge Configuration iBridge Mode [enable|disable] iBridge 1stRingPort [<port>] iBridge 2ndRingPort [<port>] iBridge Vender [moxx|advantexx|hirschmaxx]

6.1.3.25 RCS

>rcs ? Available Commands:

RCS Mode [enable|disable] RCS Add [<ip_addr>] [<port_list>] [web_on|web_off] [telnet_on|telnet_off] [snmp_on|snmp_off] RCS Del <index> RCS Configuration

6.1.3.26 FastRecovery

>fastrecovery ? Available Commands:

Fastrecovery Mode [enable|disable] Fastrecovery Port [<port_list>] [<fr_priority>]

6.1.3.27 DualPort

>dualport ? Available Commands:

DualPort Configuration [enable|disable] DualPort Port <port> DualPort Interval <integer> DualPort Retry <integer> DualPort TimeoutDelay <integer> DualPort DebugMessage [enable|disable]

6.1.3.28 SFP

>sfp ? Available Commands:

SFP syslog [enable|disable] SFP temp [<temperature>] SFP Info

6.1.3.29 Device Binding

>devicebinding ? Available Commands:

DeviceBinding Mode [enable|disable] DeviceBinding Port Mode [<port_list>] [disable|scan|binding|shutdown] DeviceBinding Port DDOS Mode [<port list>] [enable|disable] DeviceBinding Port DDOS Sensibility [<port_list>] [low|normal|medium|high] DeviceBinding Port DDOS Packet [<port_list>] [rx_total|rx_unicast|rx_multicast|rx_broadcast|tcp|udp] DeviceBinding Port DDOS Low [<port_list>] [<socket_number>] DeviceBinding Port DDOS High [<port_list>] [<socket_number>] DeviceBinding Port DDOS Filter [<port_list>] [source|destination] DeviceBinding Port DDOS Action [<port_list>] [do_nothing|block_1_min|block_10_mins|block|shutdown|only_log] DeviceBinding Port DDOS Status [<port_list>] DeviceBinding Port Alive Mode [<port_list>] [enable|disable] DeviceBinding Port Alive Action [<port_list>] [do_nothing|link_change|shutdown|only_log] DeviceBinding Port Alive Status [<port_list>] DeviceBinding Port Stream Mode [<port_list>] [enable|disable] DeviceBinding Port Stream Action [<port_list>] [do_nothing|only_log] DeviceBinding Port Stream Status [<port_list>] DeviceBinding Port Addr [<port_list>] [<ip_addr>] [<mac_addr>] DeviceBinding Port Alias [<port_list>] [<ip_addr>] DeviceBinding Port DeviceType [<port_list>] [unknown|ip_cam|ip_phone|ap|pc|plc|nvr] DeviceBinding Port Location [<port_list>] [<device_location>] DeviceBinding Port Description [<port_list>] [<device_description>]

6.1.3.30 MRP

>mrp ? Available Commands:

MRP Configuration MRP Mode [enable|disable] MRP Manager [enable|disable] MRP React [enable|disable] MRP 1stRingPort [<mrp_port>] MRP 2ndRingPort [<mrp_port>] MRP Parameter MRP_TOPchgT [<value>] MRP Parameter MRP_TOPNRmax [<value>] MRP Parameter MRP_TSTshortT [<value>] MRP Parameter MRP_TSTdefaultT [<value>] MRP Parameter MRP_TSTNRmax [<value>] MRP Parameter MRP_LNKdownT [<value>] MRP Parameter MRP_LNKdownT [<value>] MRP Parameter MRP_LNKupT [<value>]

6.1.3.31 Modbus

>modbus ? Available Commands:

Modbus Status Modbus Mode [enable|disable]

6.1.3.32 RSTP

>RSTP ? Available Commands:

```
RSTP Configuration

RSTP Mode [<rstp_mode>]

RSTP BridgePriority [<priority>]

RSTP HelloTime [<hello>]

RSTP MaxAge [<max_age>]

RSTP FwdDelay [<delay>]

RSTP FwdDelay [<delay>]

RSTP Port Configuration [<stp_port_list>]

RSTP Port Configuration [<stp_port_list>]

RSTP Port Mode [<stp_port_list>] [enable|disable]

RSTP Port Edge [<stp_port_list>] [enable|disable]

RSTP Port AutoEdge [<stp_port_list>] [enable|disable]

RSTP Port P2P [<stp_port_list>] [enable|disable]

RSTP Port Cost [<stp_port_list>] [<priority]

RSTP Port Priority [<stp_port_list>] [<priority>]
```

6.1.3.33 Auto-Logout

>auto-logout ? Available Commands:

Auto-Logout CLI [<timer>] Auto-Logout Web [<timer>]

6.1.3.34 Show

>show ? Available Commands: Show Configuration Switch Show Configuration Port <port_list>

7. APPENDIX A: IES22GF MODBUS INFORMATION

*Device ID/PLC is 1

*04 Read Input Register (3x) should be used.

*The returned values are in hex format

Address	Description
